# Recursion

- We've already seen some examples
- A very natural approach when the data structure is recursive (e.g. lists, trees)  
<https://powcoder.com>  
Assignment Project Exam Help
- But also examples of naturally recursive array processing algorithms  
Add WeChat powcoder
- Next week we'll express **depth first graph traversal** recursively (the natural way); later we'll meet other examples of recursion too

# Example: Factorial

- $n!$ : we can use recursion (left) or iteration (right)

```
function FAC( $n$ )  
  if  $n = 0$  then  
    return 1  
  return FAC( $n - 1$ ) *  $n$ 
```

```
function FAC( $n$ )  
   $result \leftarrow 1$   
  while  $n > 0$  do  
     $result \leftarrow result * n$   
     $n \leftarrow n - 1$   
  return  $result$ 
```

$$\begin{aligned} F(5) &= F(4) \cdot 5 \\ &= (F(3) \cdot 4) \cdot 5 \\ &= ((F(2) \cdot 3) \cdot 4) \cdot 5 \\ &= (((F(1) \cdot 2) \cdot 3) \cdot 4) \cdot 5 \\ &= (((((F(0) \cdot 1) \cdot 2) \cdot 3) \cdot 4) \cdot 5) \\ &= (((((1 \cdot 1) \cdot 2) \cdot 3) \cdot 4) \cdot 5) \\ &= 120 \end{aligned}$$

$n: 0$   
 $result: 120$   
*iterative version  
normally  
preferred since it is  
constant space*

# Example: Fibonacci Numbers

THE UNIVERSITY OF  
MELBOURNE

- To generate the  $n$ th number of sequence: 1 1 2 3 5  
8 13 21 34 55 ...

```
function FIB( $n$ )  
  if  $n = 0$  then  
    return 1  
  if  $n = 1$  then  
    return 1  
  return FIB( $n - 1$ ) + FIB( $n - 2$ )
```

Follows the mathematical  
definition of Fibonacci  
numbers very closely.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Easy to understand

But performs lots of  
redundant computation

Basic operation: addition

Complexity is **exponential** in  $n$

# Fibonacci Again

- Of course we only need to remember the latest two items. Recursive version: left; iterative version: right

```
function FIB( $n, a, b$ )  
  if  $n = 0$  then  
    return  $a$   
  return FIB( $n - 1, a + b, a$ )
```

```
function FIB( $n$ )  
   $a \leftarrow 1$   
   $b \leftarrow 0$   
  while  $n > 0$  do  
     $t \leftarrow a$   
     $a \leftarrow a + b$   
     $b \leftarrow t$   
     $n \leftarrow n - 1$   
  return  $a$ 
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Initial call: Fib( $n, 1, 0$ )

Time complexity of both solutions is linear in  $n$

(There is a cleverer, still recursive, way which is  $O(\log n)$ .)

# Tracing Recursive Fibonacci

THE UNIVERSITY OF  
MELBOURNE

```
function FIB( $n, a, b$ )  
  if  $n = 0$  then  
    return  $a$   
  return FIB( $n - 1, a + b, a$ )
```

Assignment Project Exam Help

Initial call: Fib(5, 1, 0)

Add WeChat powcoder

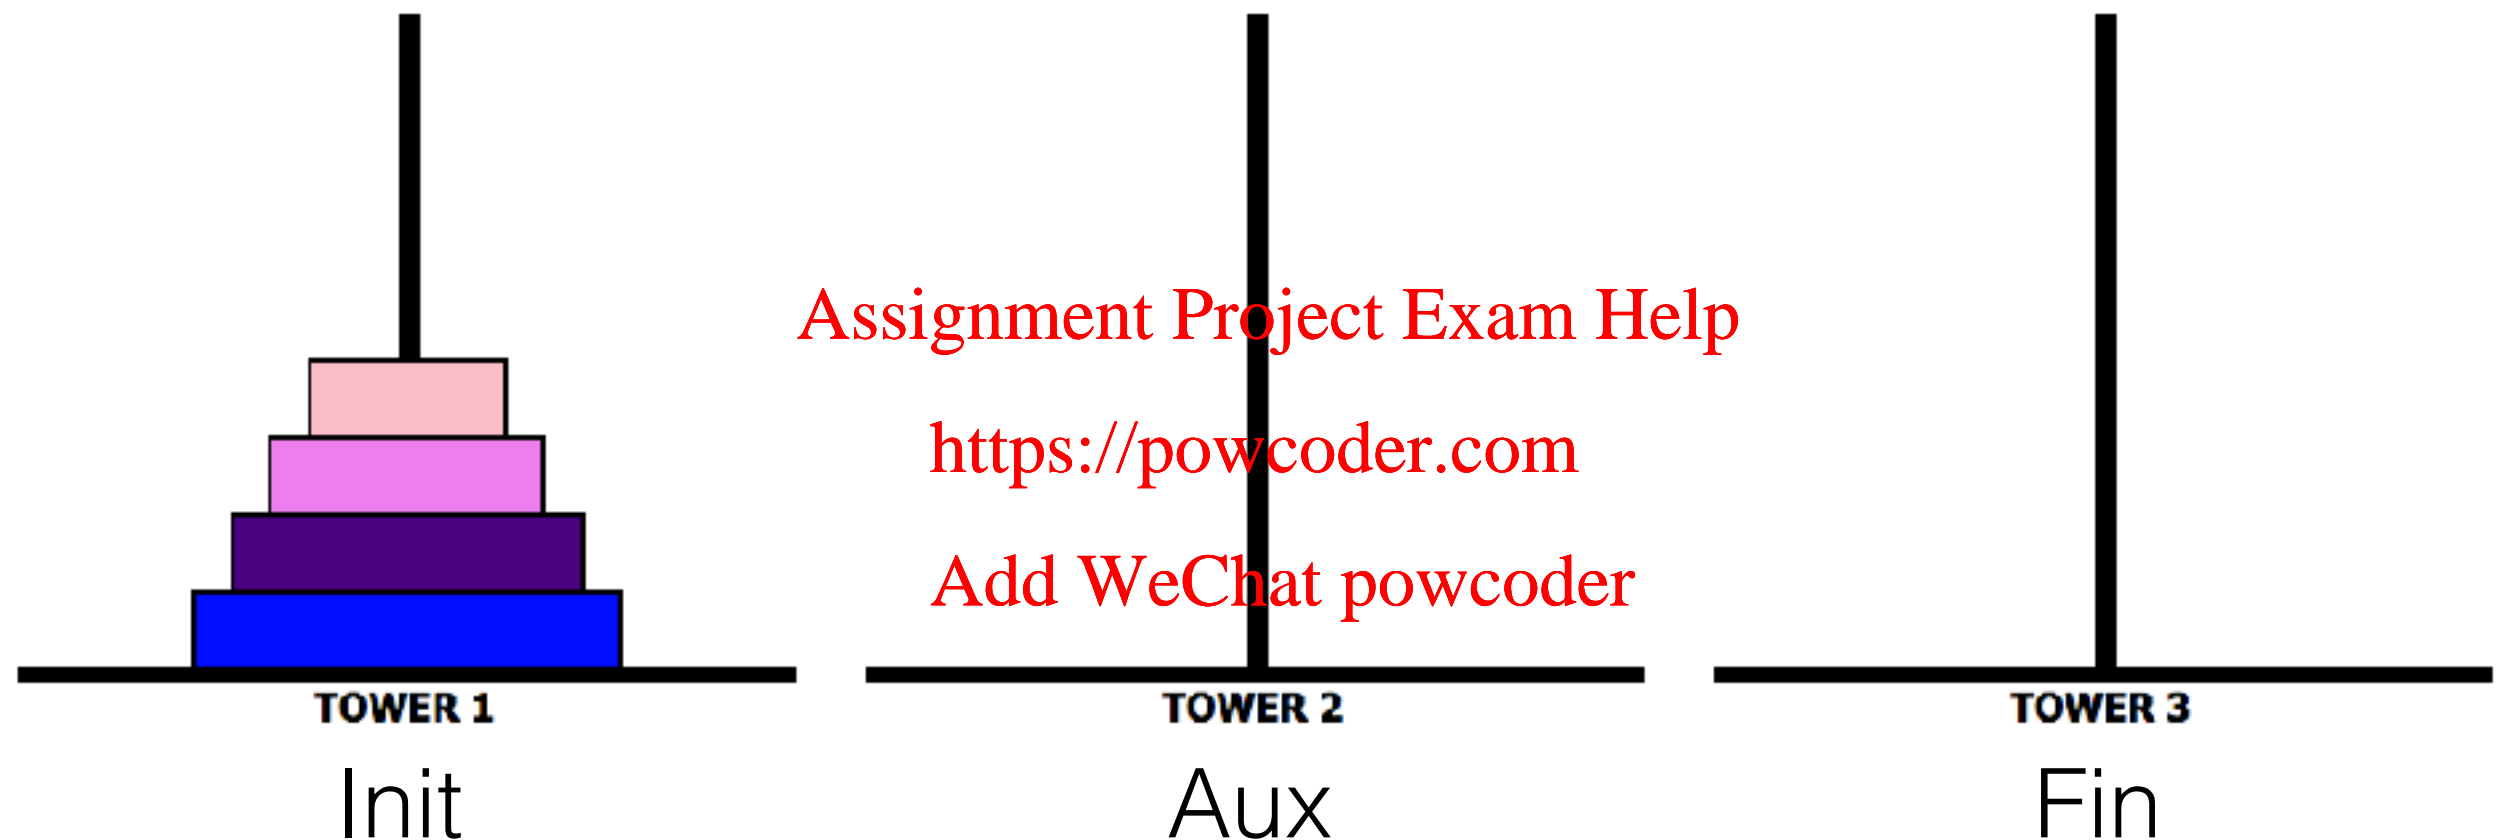

Fib(5, 1, 0)  
= Fib(4, 1, 1)  
= Fib(3, 2, 1)  
= Fib(2, 3, 2)  
= Fib(1, 5, 3)  
= Fib(0, 8, 5) = 8

Fibonacci

Sequence:

1 1 2 3 5 8 ...

# Tower of Hanoi

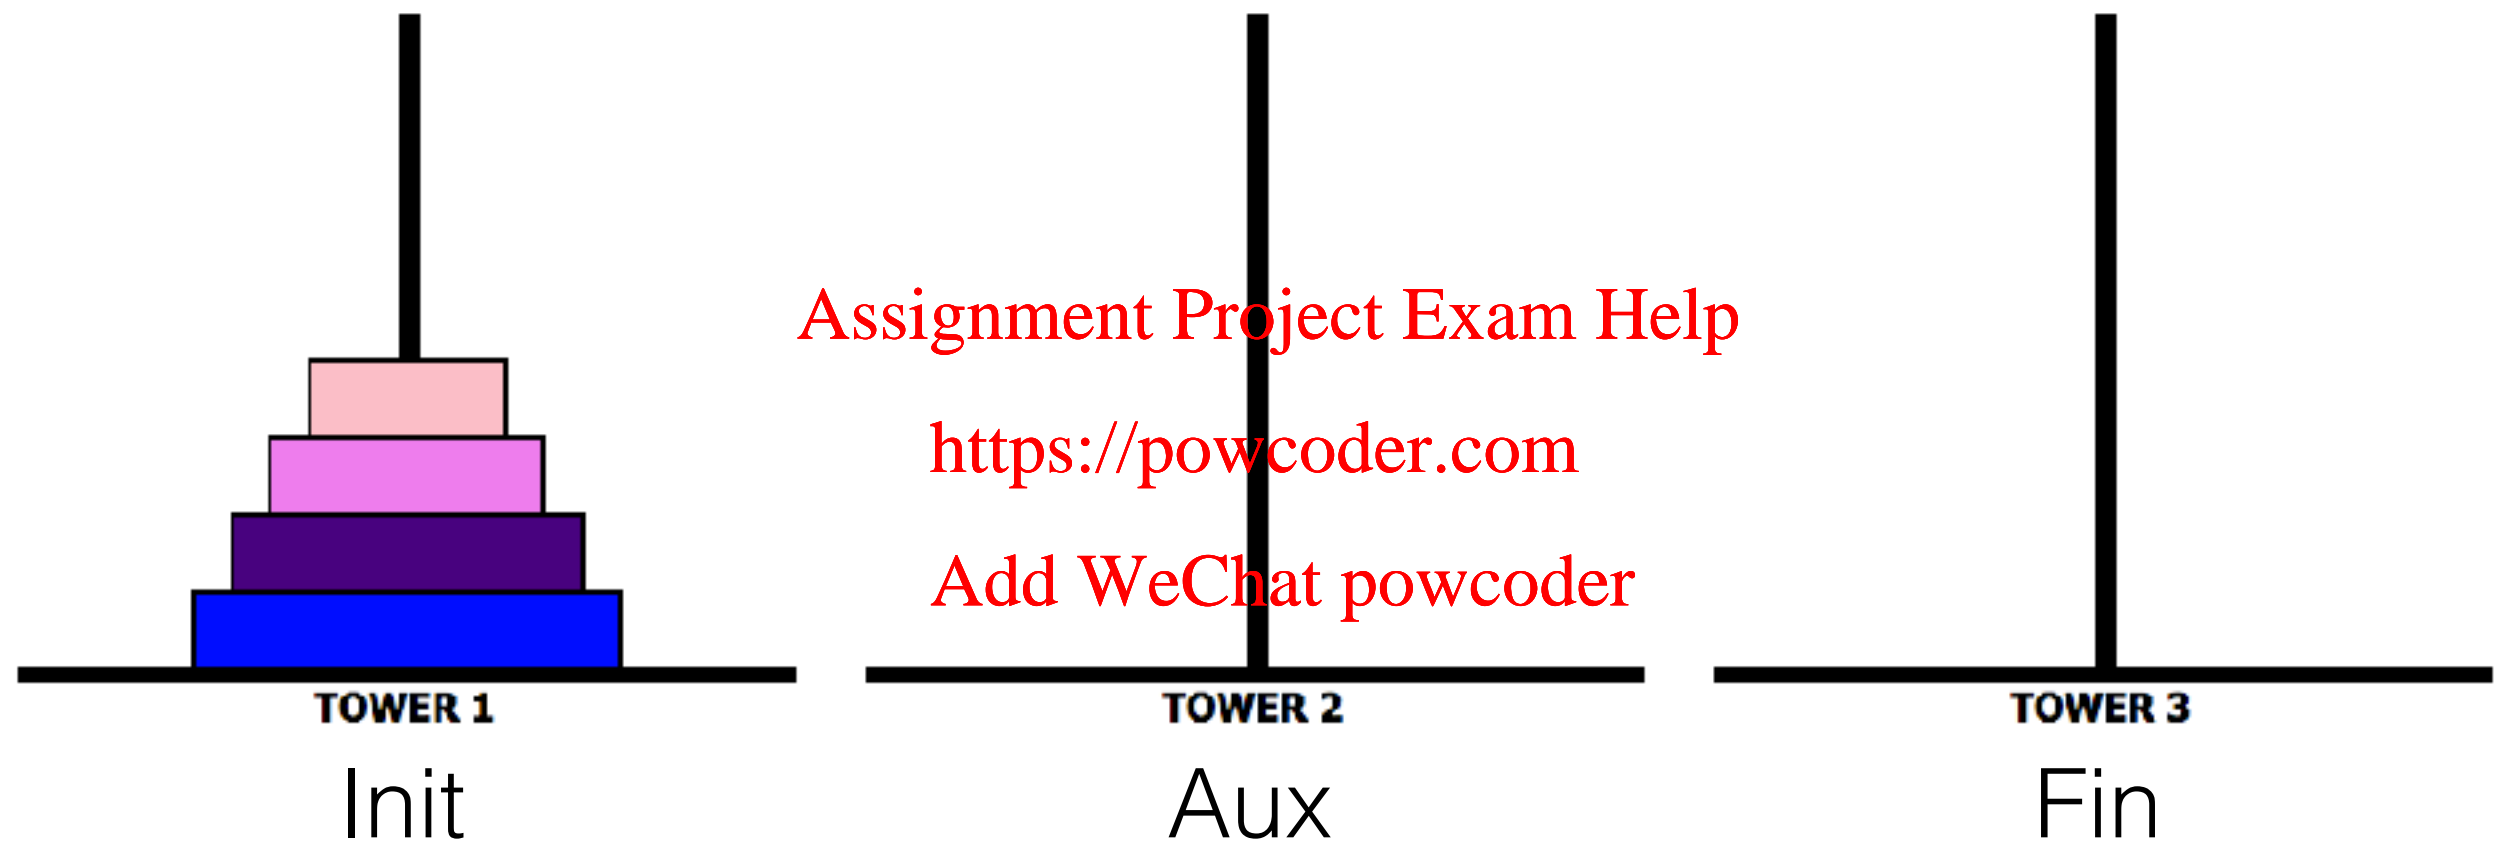

Move  $n$  disks from *Init* to *Fin*. A larger disk can never be placed on top of a smaller one.

# Tower of Hanoi: Recursive Solution

THE UNIVERSITY OF  
MELBOURNE

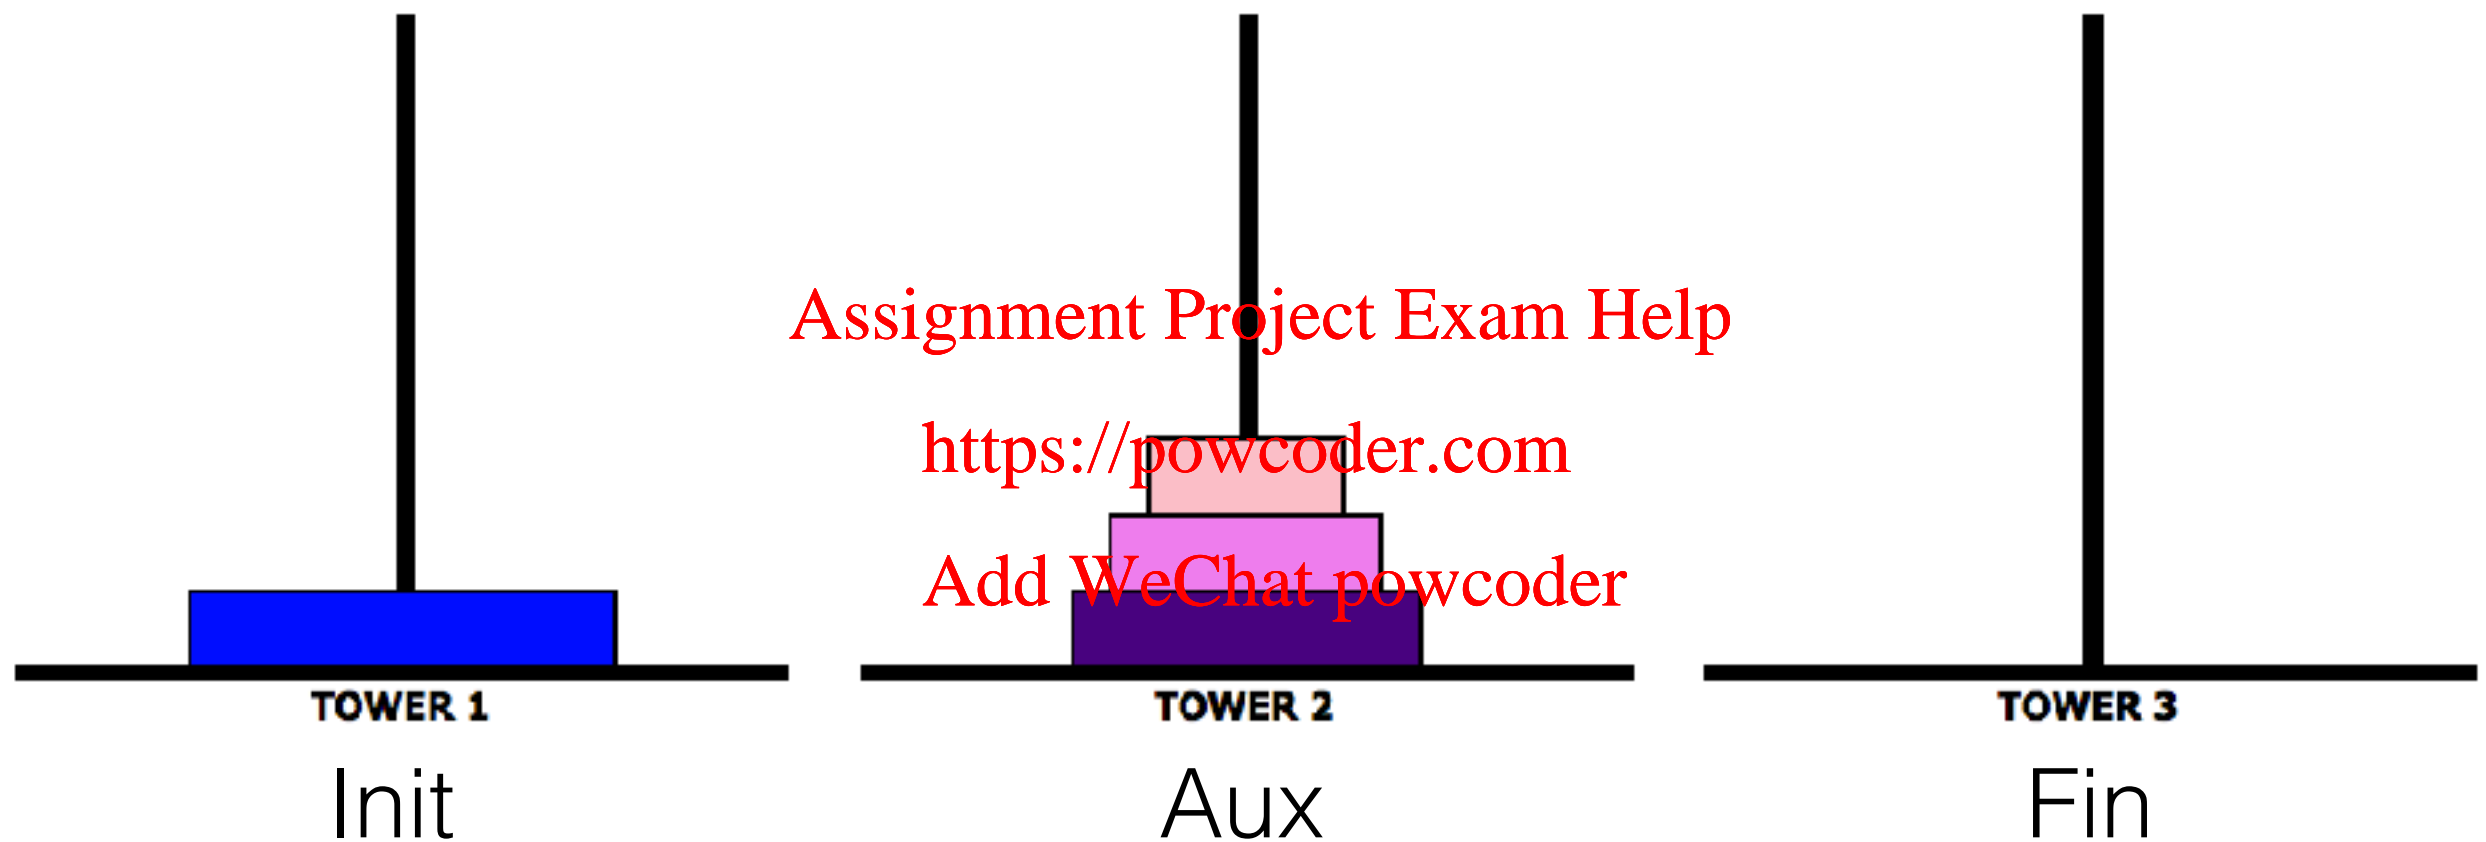

Move  $n-1$  disks from Init to Aux.

# Tower of Hanoi: Recursive Solution

THE UNIVERSITY OF  
MELBOURNE

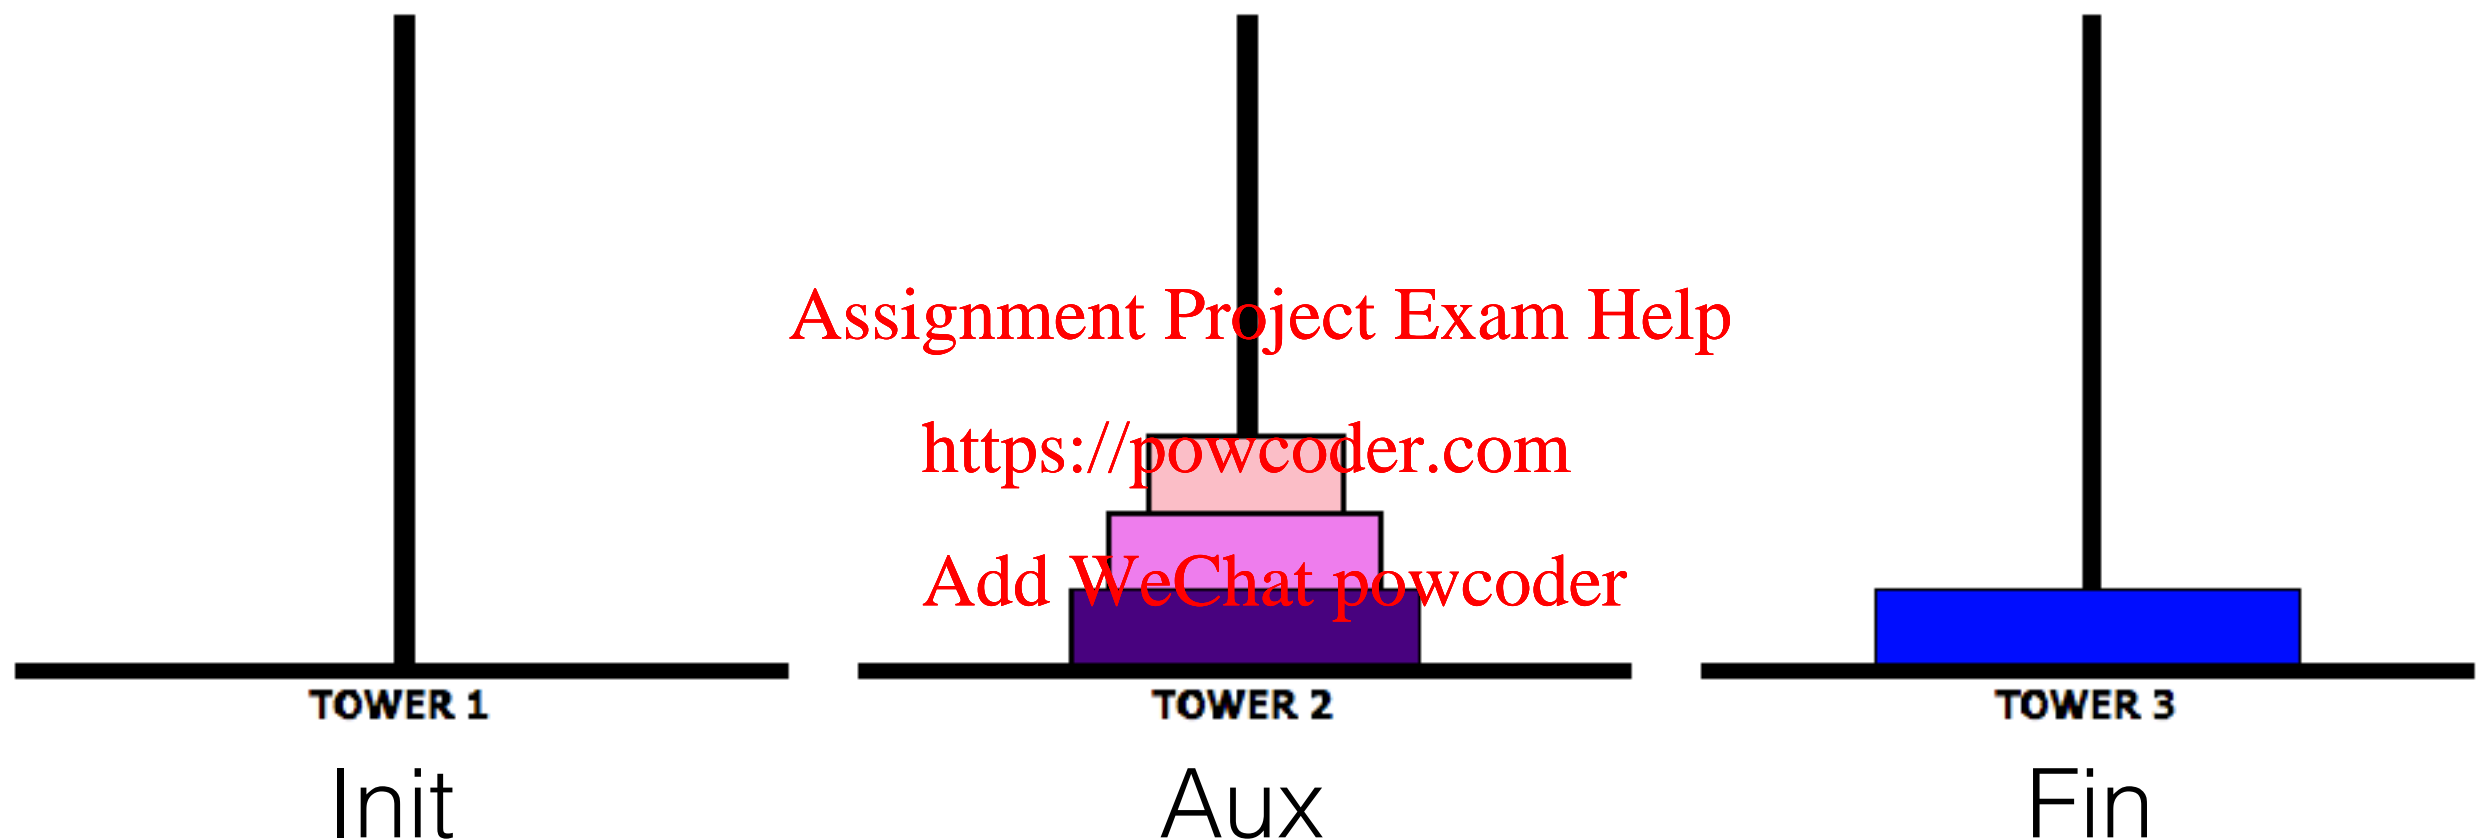

Move  $n-1$  disks from Init to Aux.  
Then move the  $n$ th disk to Fin.

# Tower of Hanoi: Recursive Solution

THE UNIVERSITY OF

# A Challenge: Coin Change Problem

- There are 6 different kinds of Australian coin
- In cents, their values are: 5, 10, 20, 50, 100, 200

Assignment Project Exam Help

- In how many different ways can I produce a handful of coins adding up to \$4?  
<https://powcoder.com>  
Add WeChat powcoder

- This is not an easy problem!
- Key to solving it is to find a way to break it down into simpler sub-problems

# Coin Change Problem: Decomposition

\$4

Does the bag contain a \$2 coin?

Assignment Project Exam Help

<https://powcoder.com>

Yes

Add WeChat powcoder

No

+ \$2

\$4

made from

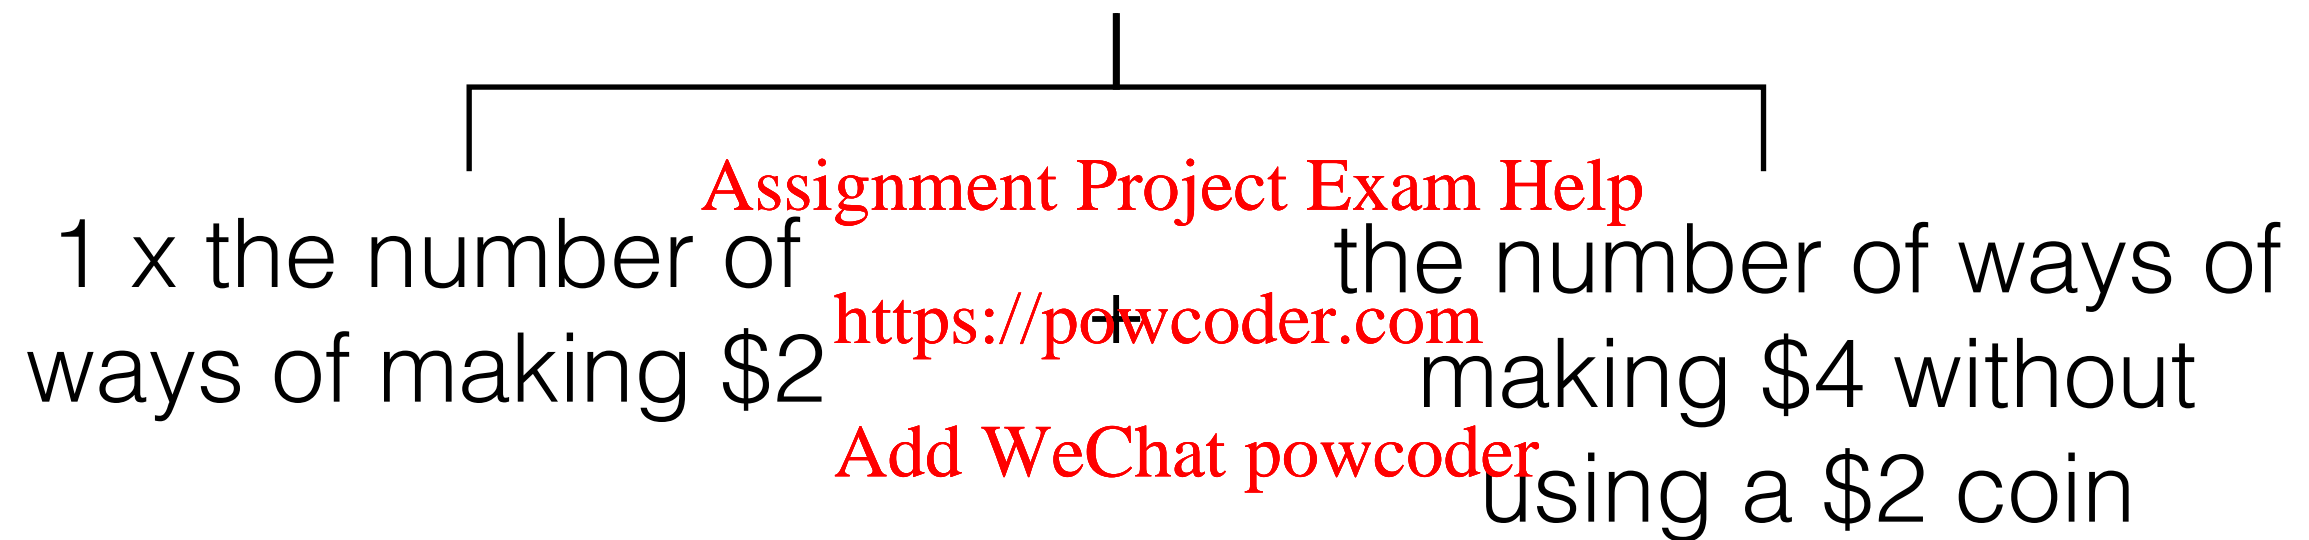

made from

# Coin Change Problem: Decomposition

The number of ways of making \$4 is therefore:

# Coin Change Problem: Partial Algorithm

```
function WAYS(amount, denominations)
    // ... base cases ....
    d ← selectLargest(denominations)
    return WAYS(amount - d, denominations) +
           WAYS(amount, denominations \ {d})
```

## For example:

$$\begin{aligned} \text{Ways}(400, \{5, 10, 20, 50, 100, 200\}) = \\ \text{Ways}(200, \{5, 10, 20, 50, 100, 200\}) + \\ \text{Ways}(400, \{5, 10, 20, 50, 100\}) \end{aligned}$$

# Coin Change Problem: Base Cases

- Each time we recurse, we decrease either:
  - amount (by subtracting some quantity from it), or
  - denominations (by removing an item from the set)
- Consider each of these separately.
  - amount base cases:
    - amount = 0:
    - amount < 0:
    - denominations =  $\emptyset$  (and amount > 0):

Assignment Project Exam Help

# Coin Change Problem: Full Recursive Algorithm

```
function WAYS(amount, denominations)
  if amount = 0 then
    return 1
  if amount < 0 then
    return 0
  if denominations =  $\emptyset$  then
    return 0
  d  $\leftarrow$  selectLargest(denominations)
  return WAYS(amount - d, denominations) +
    WAYS(amount, denominations \ {d})
```

Initial call: WAYS(amount, {5, 10, 20, 50, 100, 200}).

# Recursive Solution and its Complexity

- Although our recursive algorithm is short and elegant, it is not the most efficient way of solving the problem.

Assignment Project Exam Help

- Its running time grows **exponentially** as you grow the input amount. <https://powcoder.com> Add WeChat powcoder
- More efficient solutions can be developed using **memoing** or **dynamic programming**—more about that later (around Week 10).

# Next Time...
