Breadth-First and Depth-First Traversal

Used to systematically explore all nodes of a graph

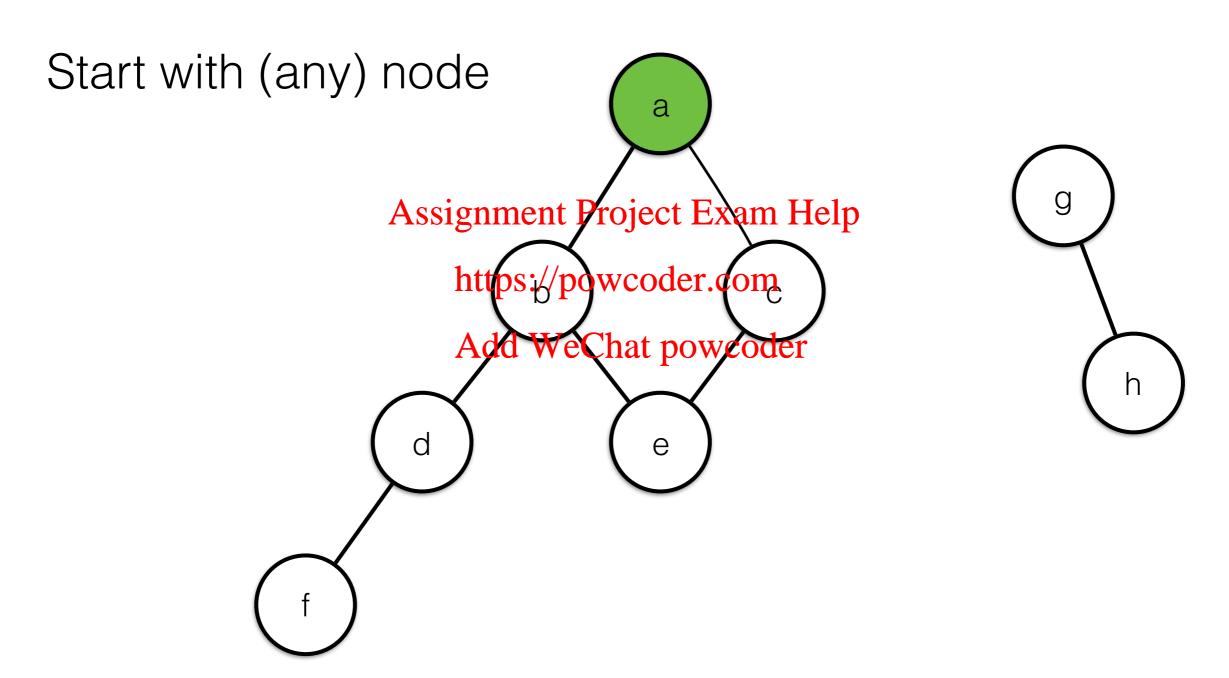

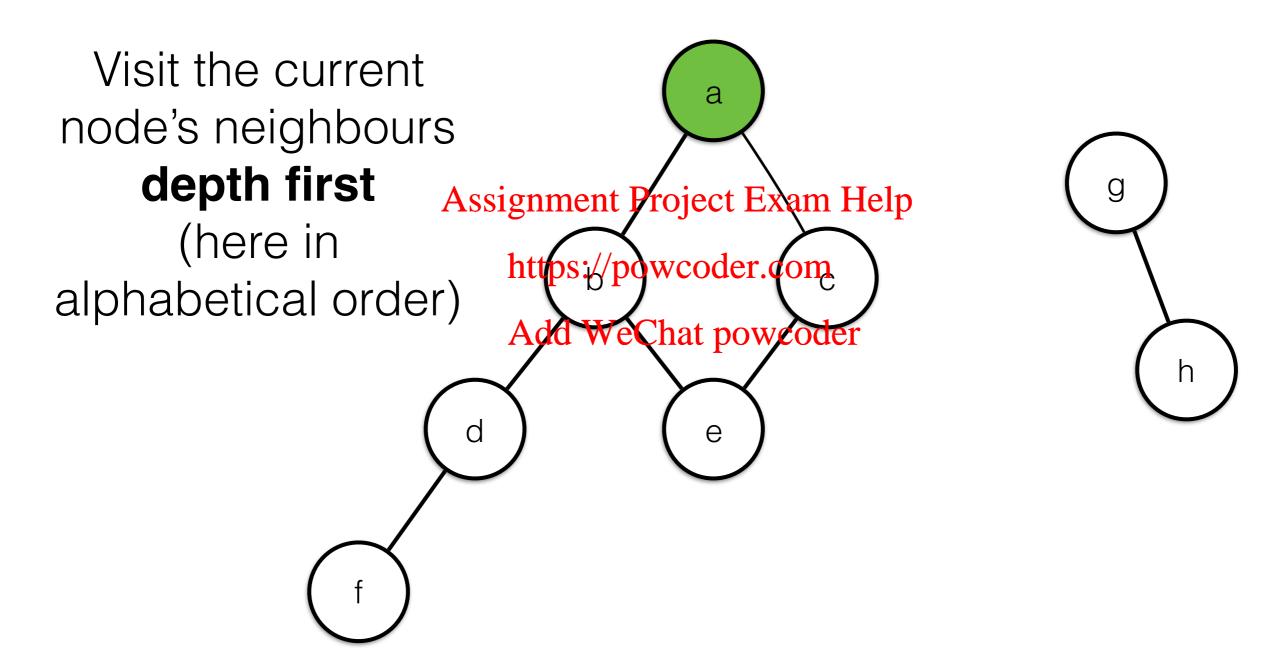

Nodes visited in this order: a

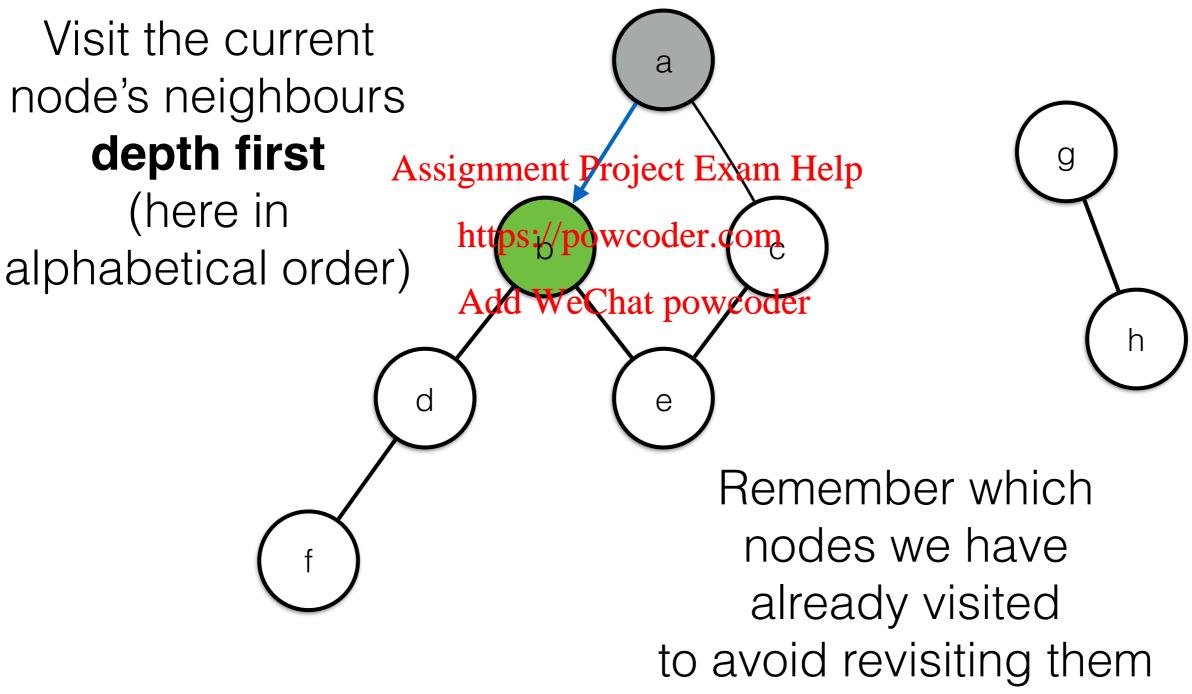

Nodes visited in this order: a

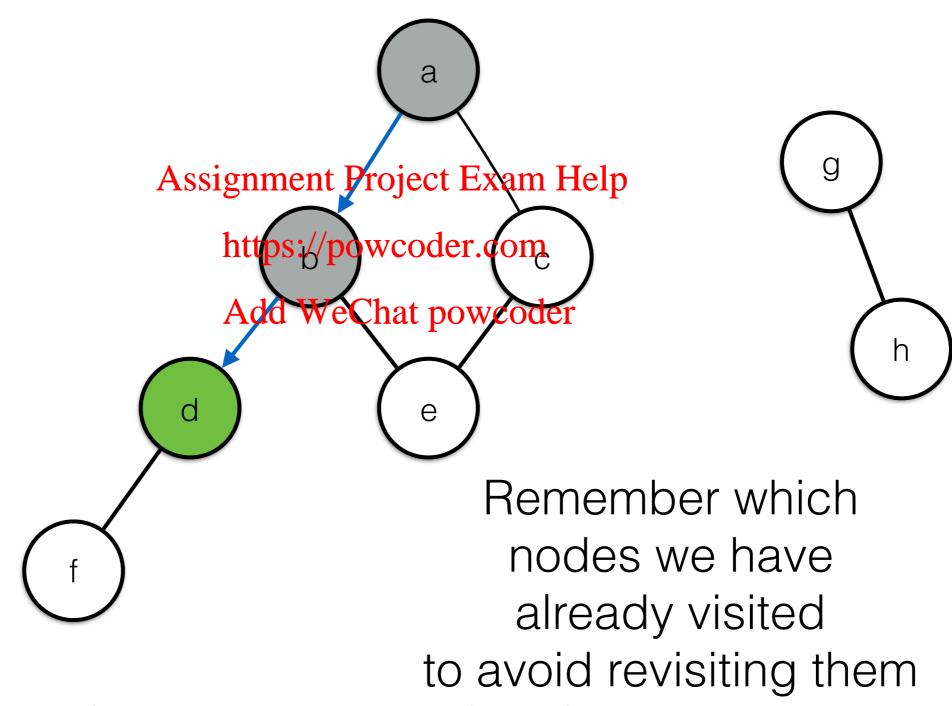

Nodes visited in this order: a b

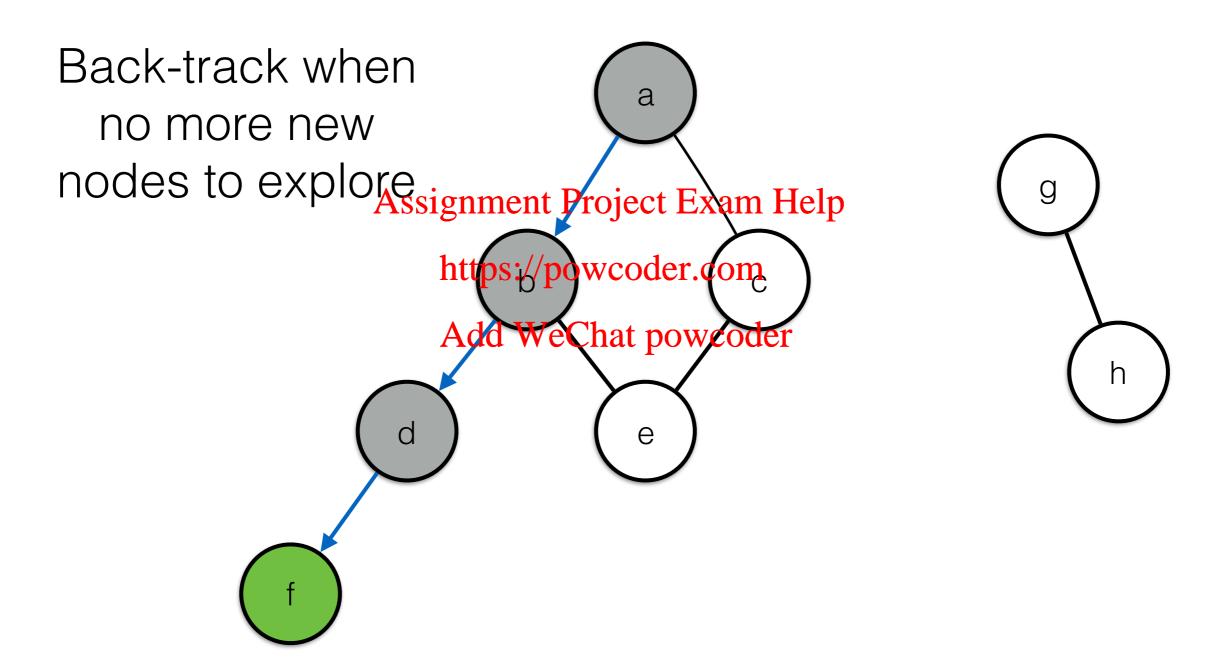

Nodes visited in this order: a b d

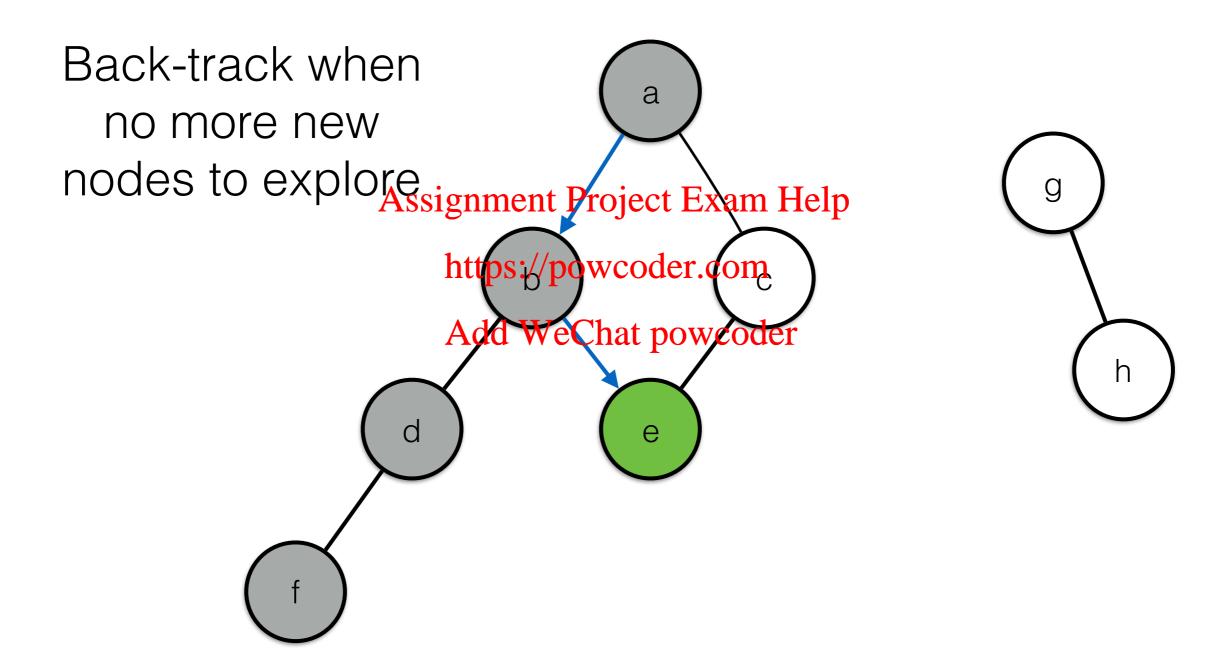

Nodes visited in this order: a b d f

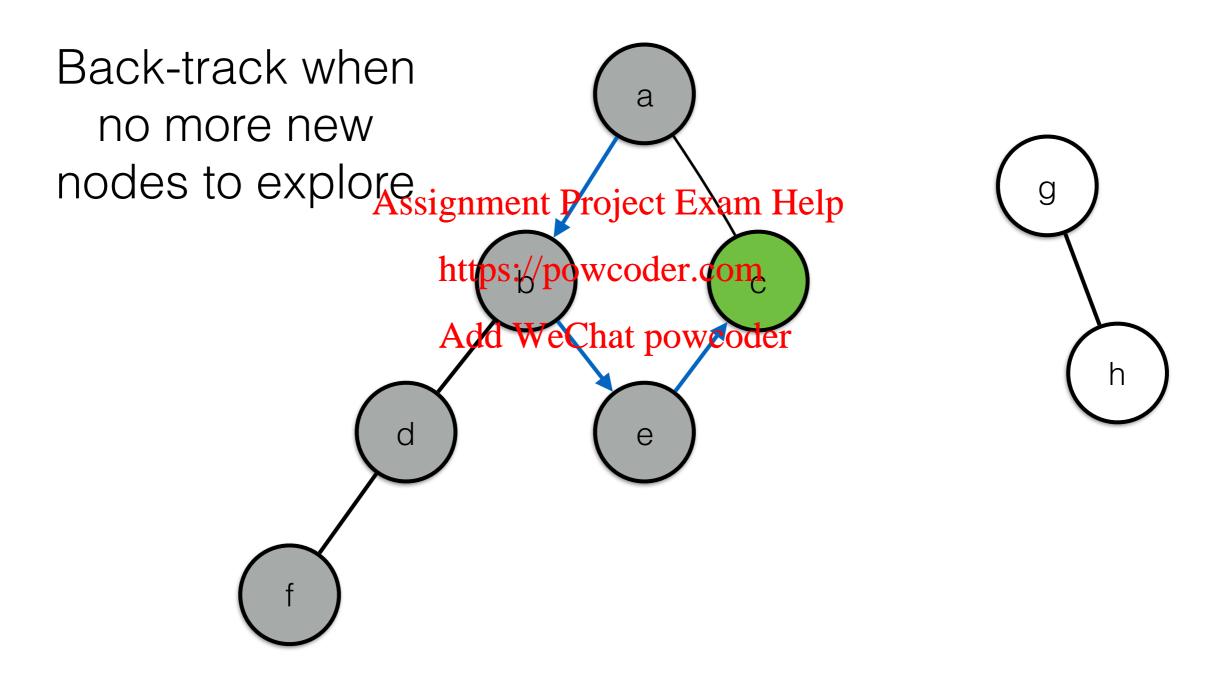

Nodes visited in this order: a b d f e

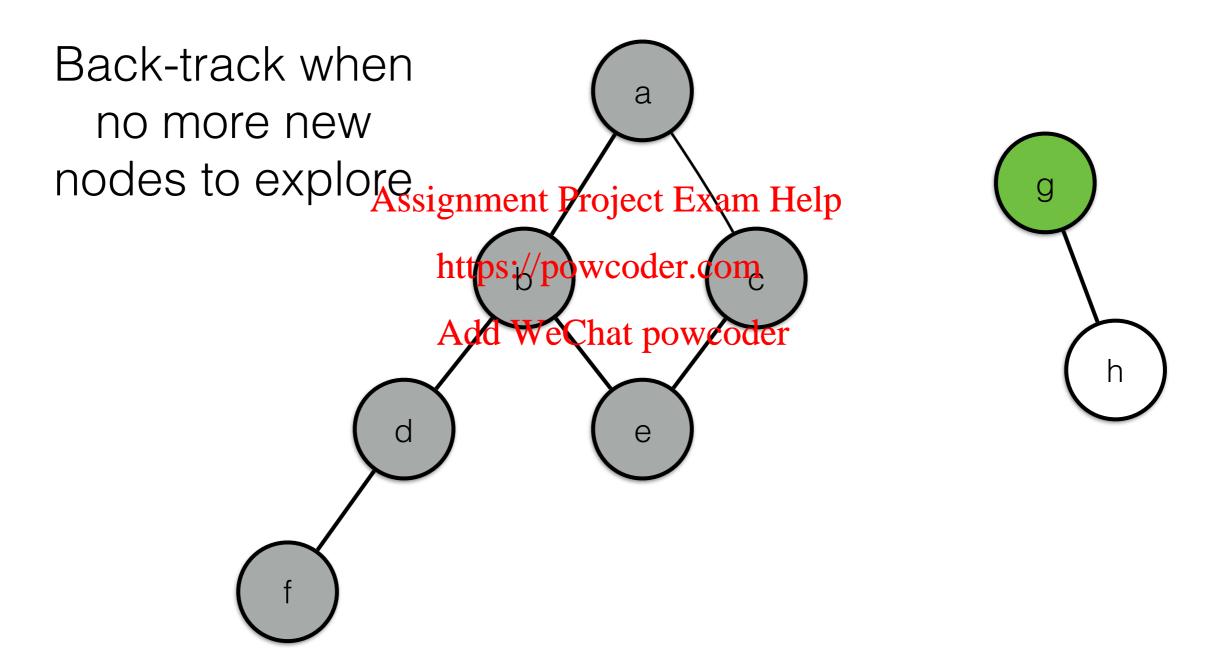

Nodes visited in this order: a b d f e c

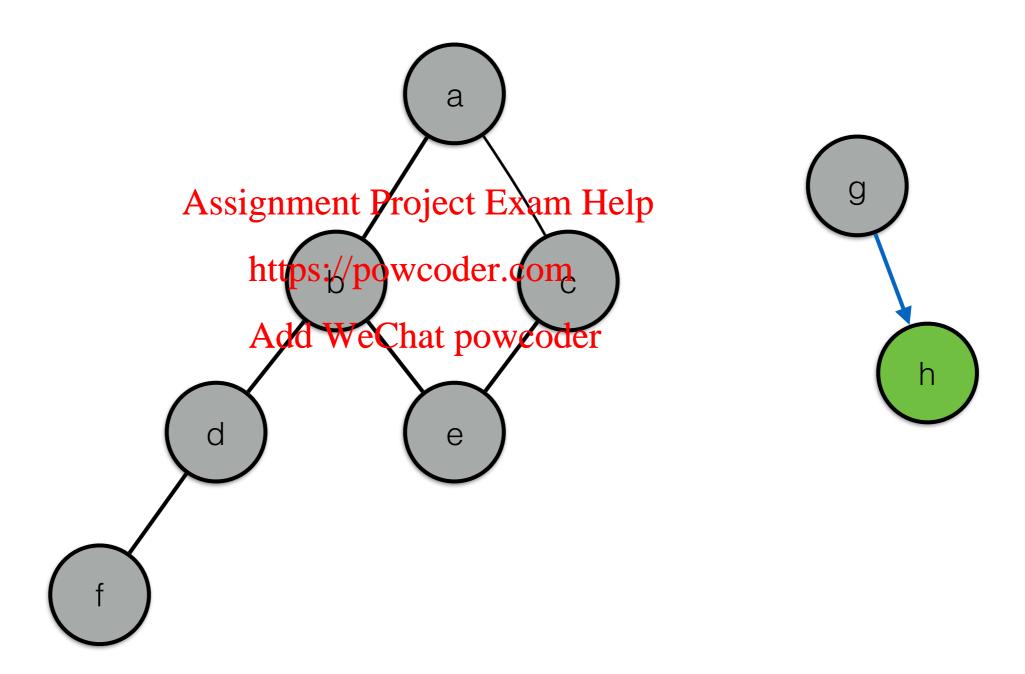

Nodes visited in this order: a b d f e c g

Nodes visited in this order: a b d f e c g h

When back-tracking, we go back to the most recentlyvisited node that still has unvisited neighbours

This is simulated by pushing each node onto a stack Assignment Psojeist Feath Help

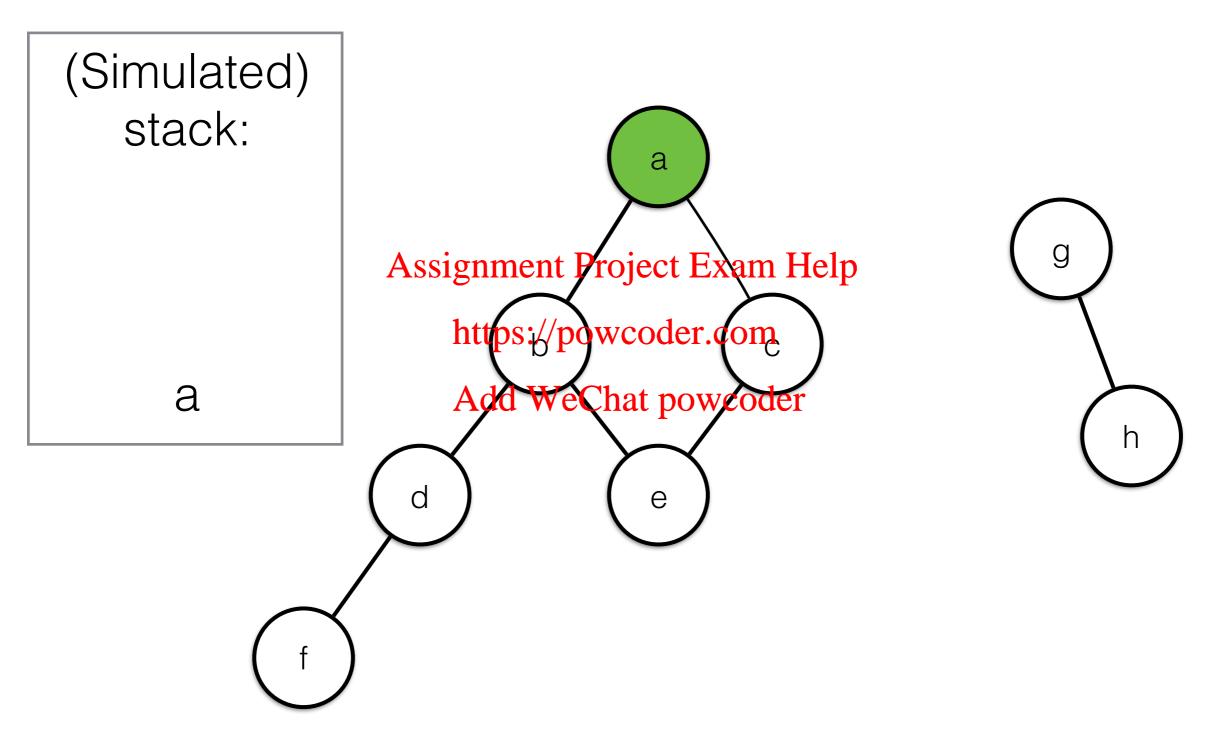

https://powcoder.com

Back-tracking then corresponds to popping the stack.

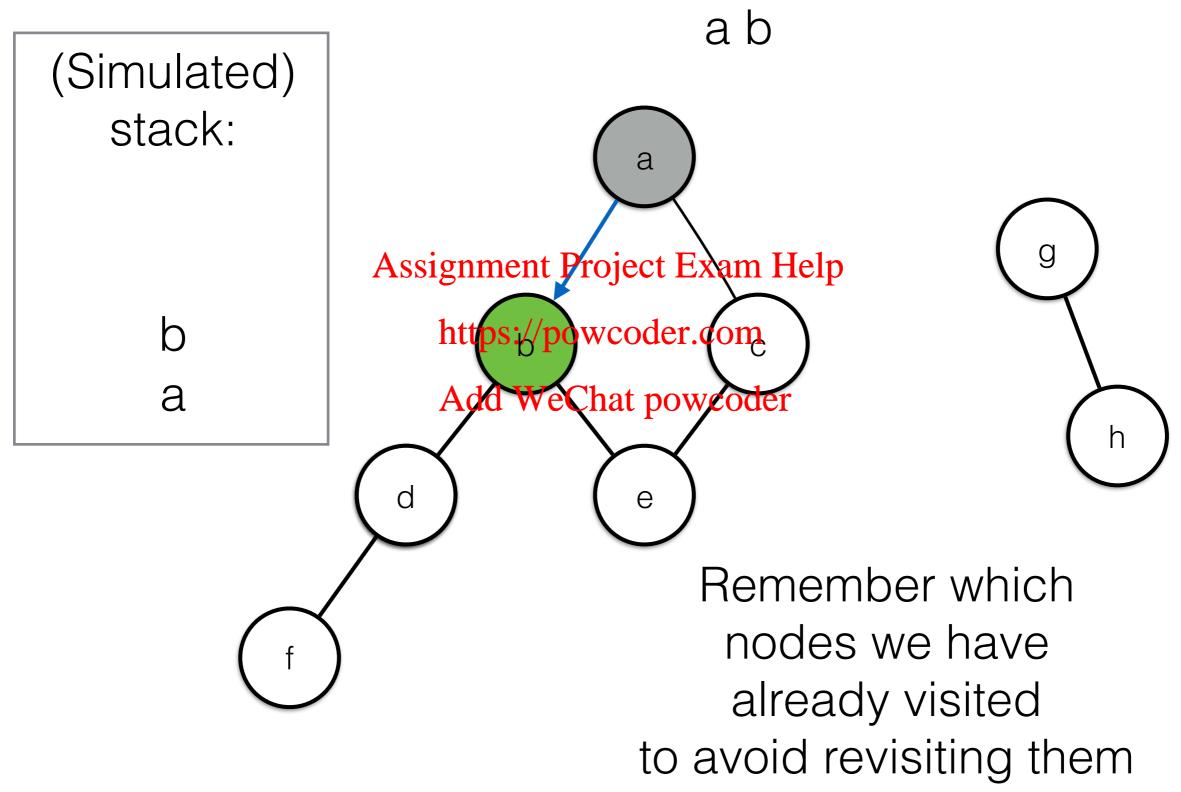

(Simulated) stack: а Assignment Project Exam Help ps://powcoder.com WeChat poweoder

Depth-First Search: Recursive Algorithm Notes

- · Works both for directed and undirected graphs.
- The "marking" of nodes is usually done by maintaining a separate array, mark, indexed by V.
- For example, when we with open, with open, that would be implemented as "mark[v] := count".

 https://powcoder.com
- How to find the nodes adjacent that property on the graph representation used.
- Using an adjacency **matrix** adj, we need to consider adj[v,w] for each w in V. Here the complexity of graph traversal is $\Theta(|V|^2)$.
- Using adjacency lists, for each v, we traverse the list adj[v].
 In this case, the complexity of traversal is Θ(|V| + |E|).

Applications of Depth-First Search (DFS)

 Easy to adapt DFS to decide if a graph is connected.

function DFS($\langle V, E \rangle$) mark each node in V with 0 count \leftarrow 0

for each v in V do

Assignment Project Exame Help marked with 0 then

https://powcoder.com DFSEXPLORE(v)

How?

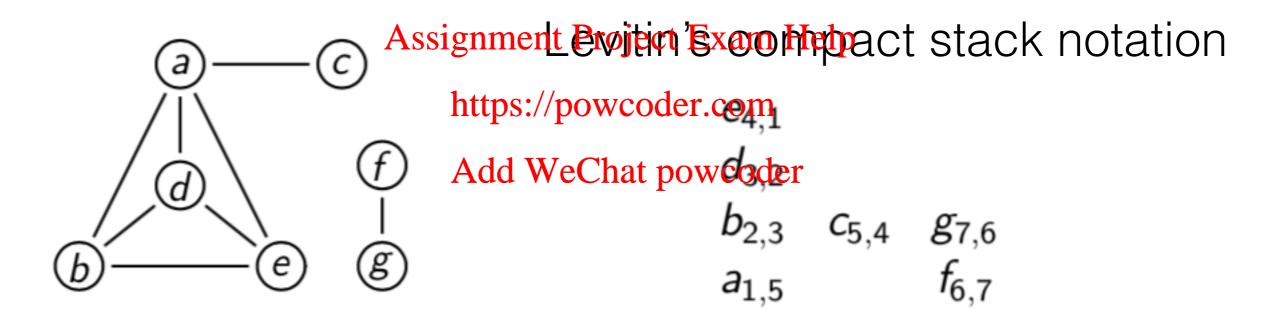

Add WeChat powcoder

function DfsExplore(v)
 count ← count + 1
 mark v with count
 for each edge (v, w) do
 if w is marked with 0 then
 DfsExplore(w)

Depth-First Search: Node Orderings

 We can order nodes either by the order in which they get pushed onto the stack, or by the order in which they are popped from the stack

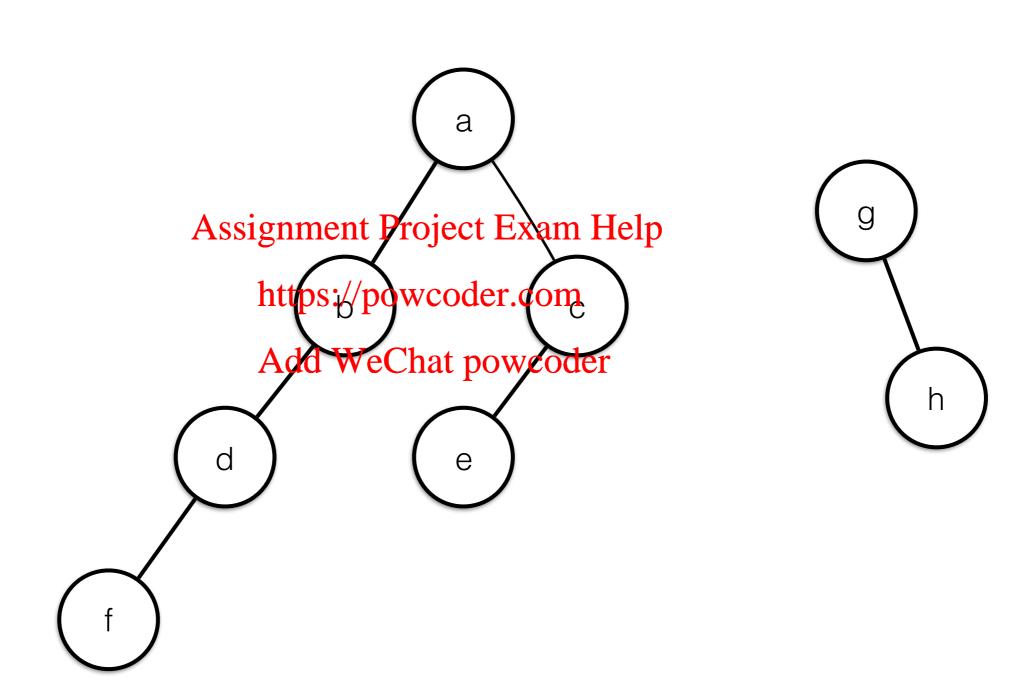

The first subscripts give the order in which nodes are pushed, the second the order in which they are popped off the stack.

Depth-First Search Forest

Depth-First vs Breadth-First Search

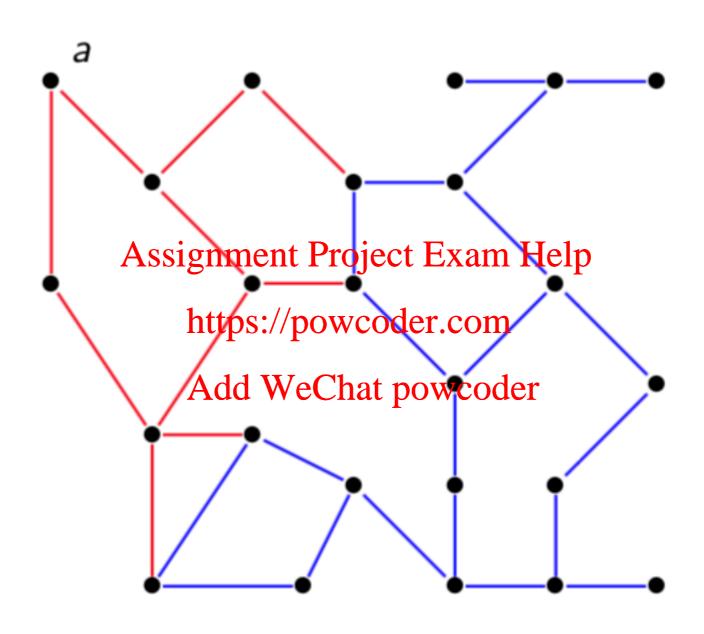

Typical Depth-First Search

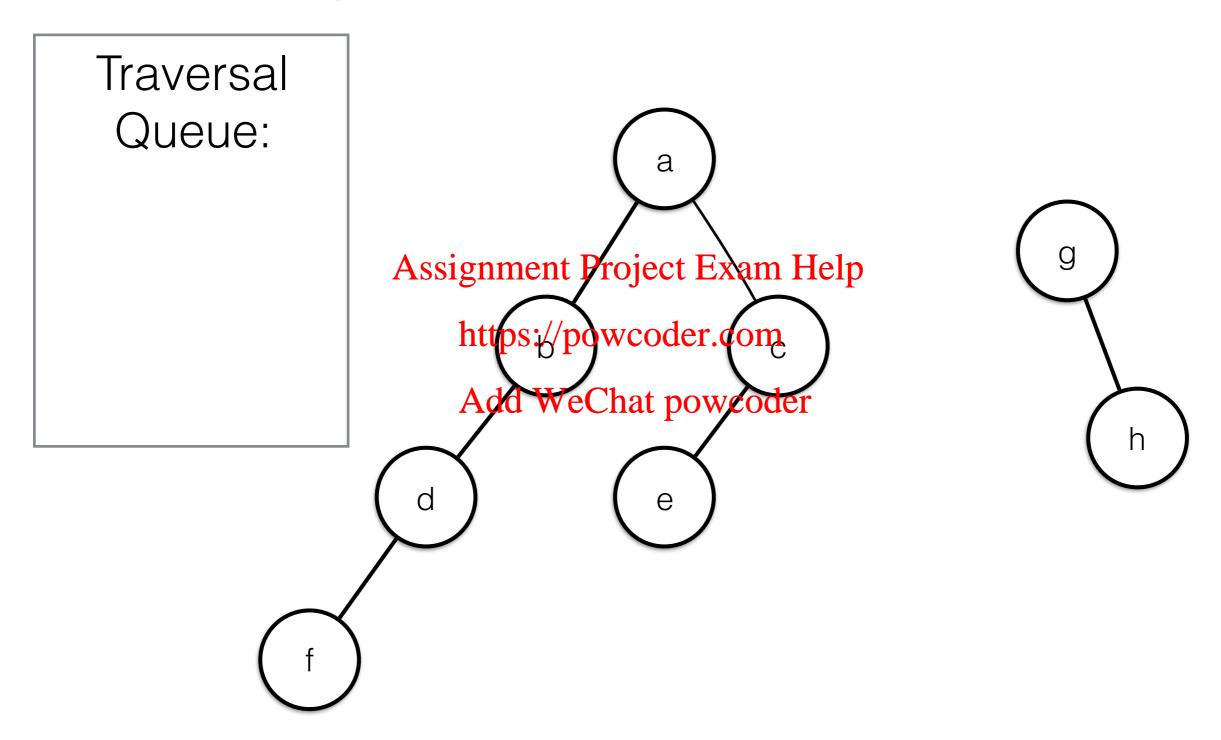

Depth-First vs Breadth-First Search

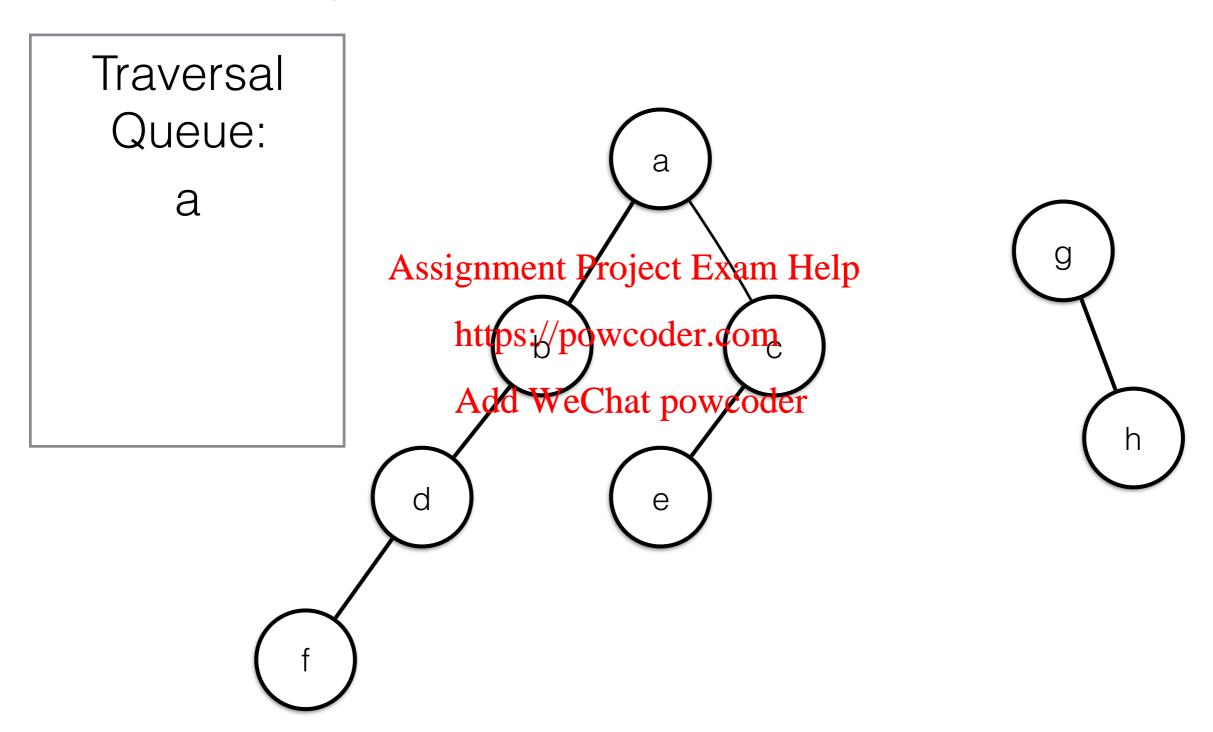

Typical Breadth-First Search

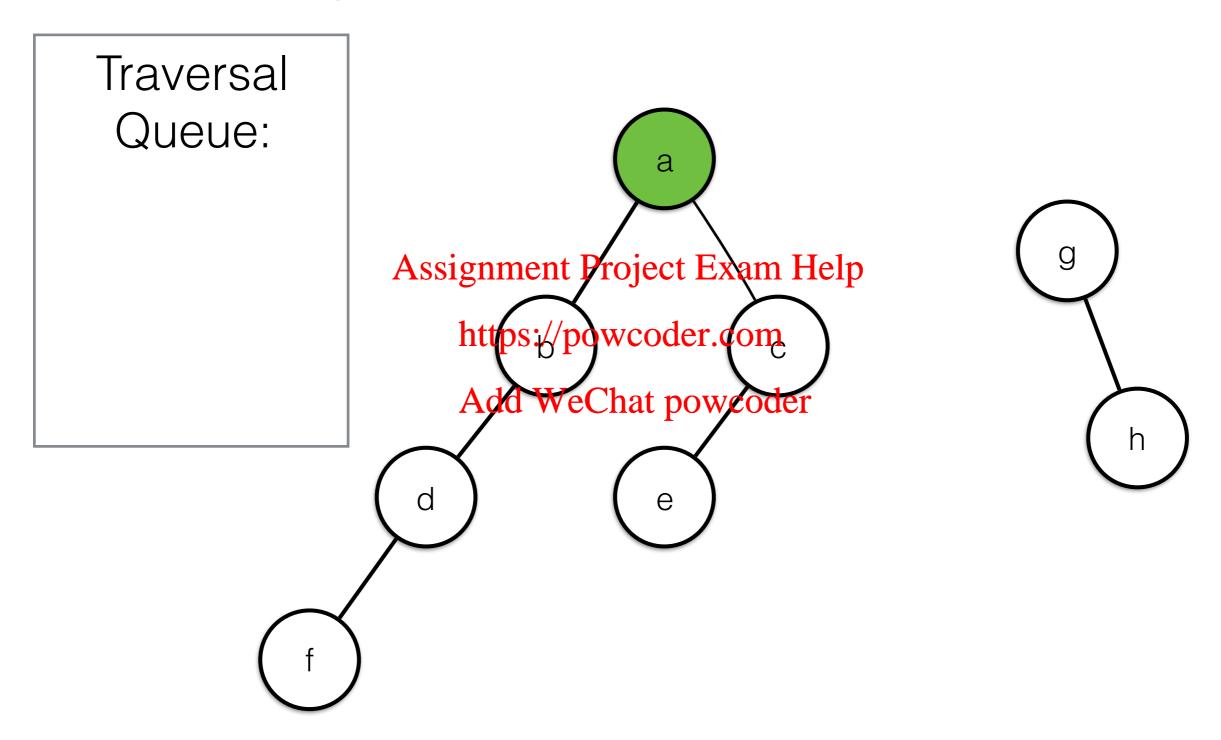

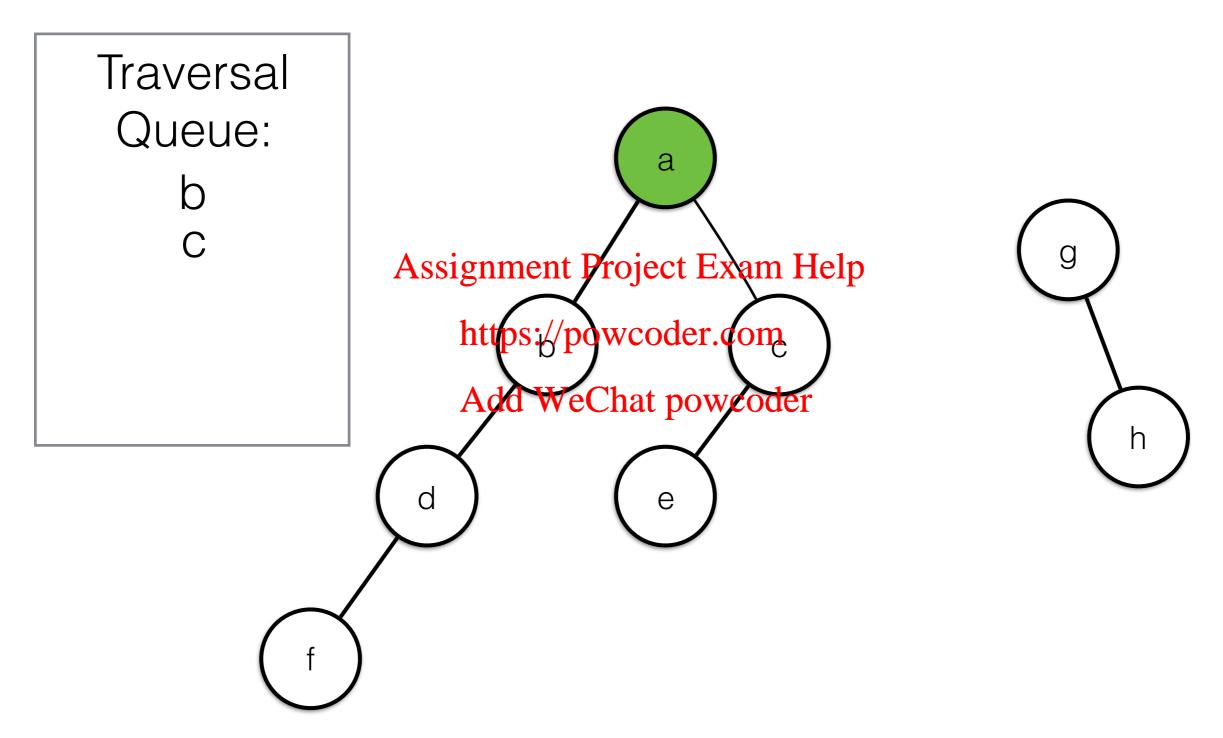

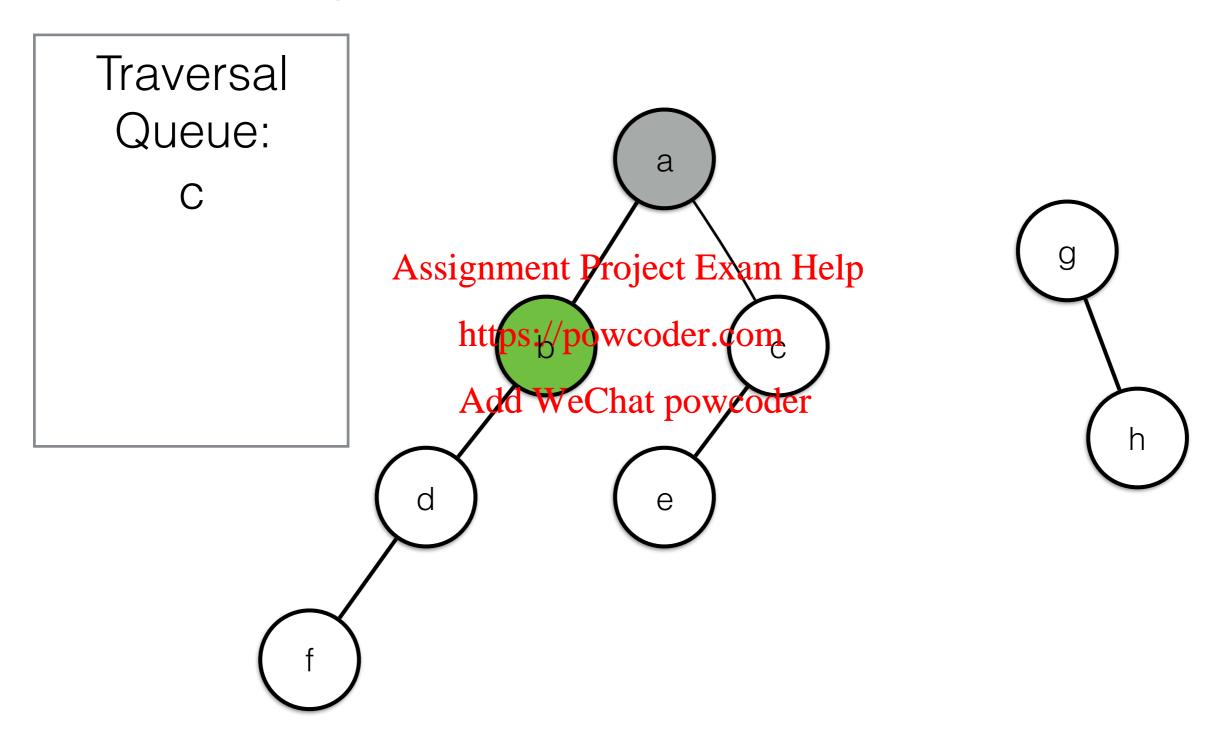

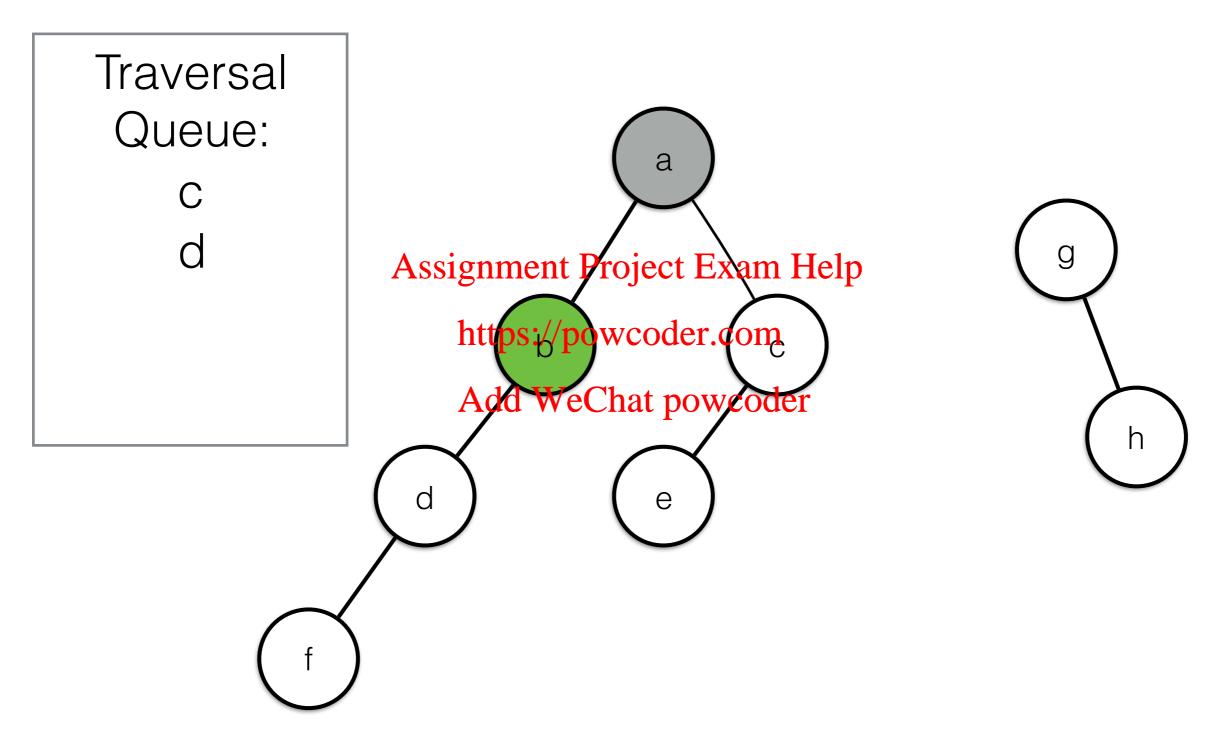

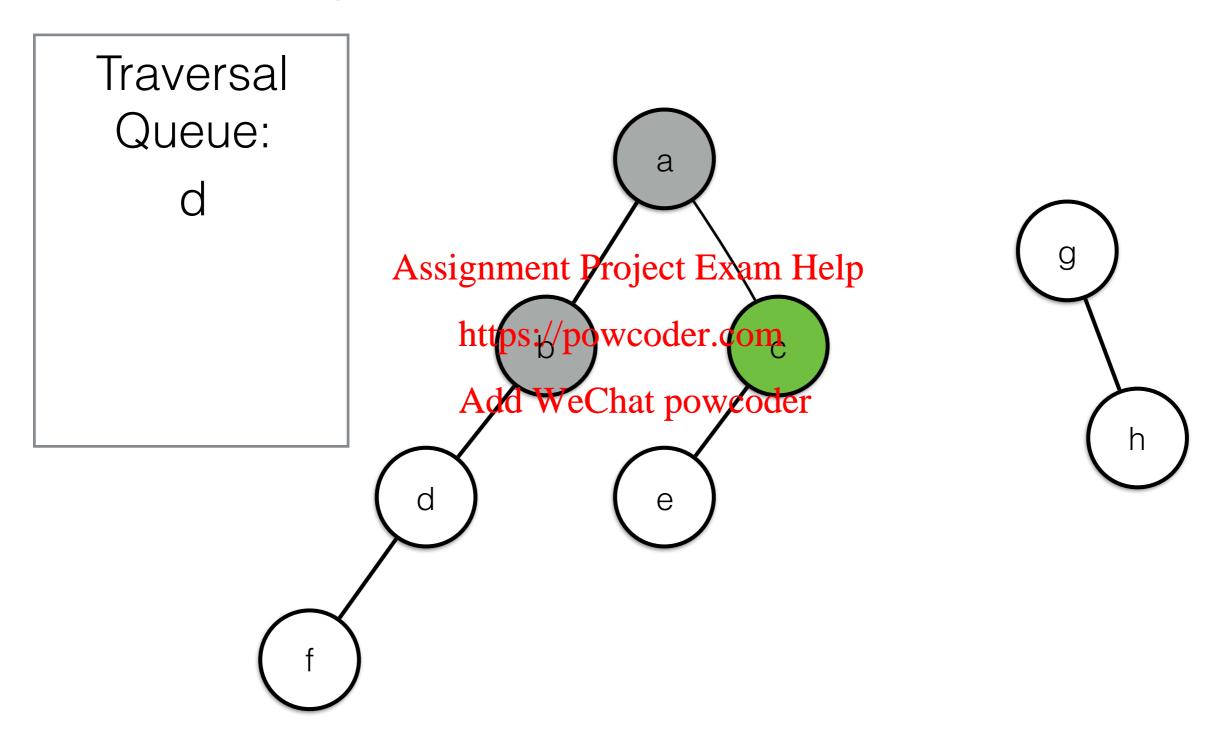

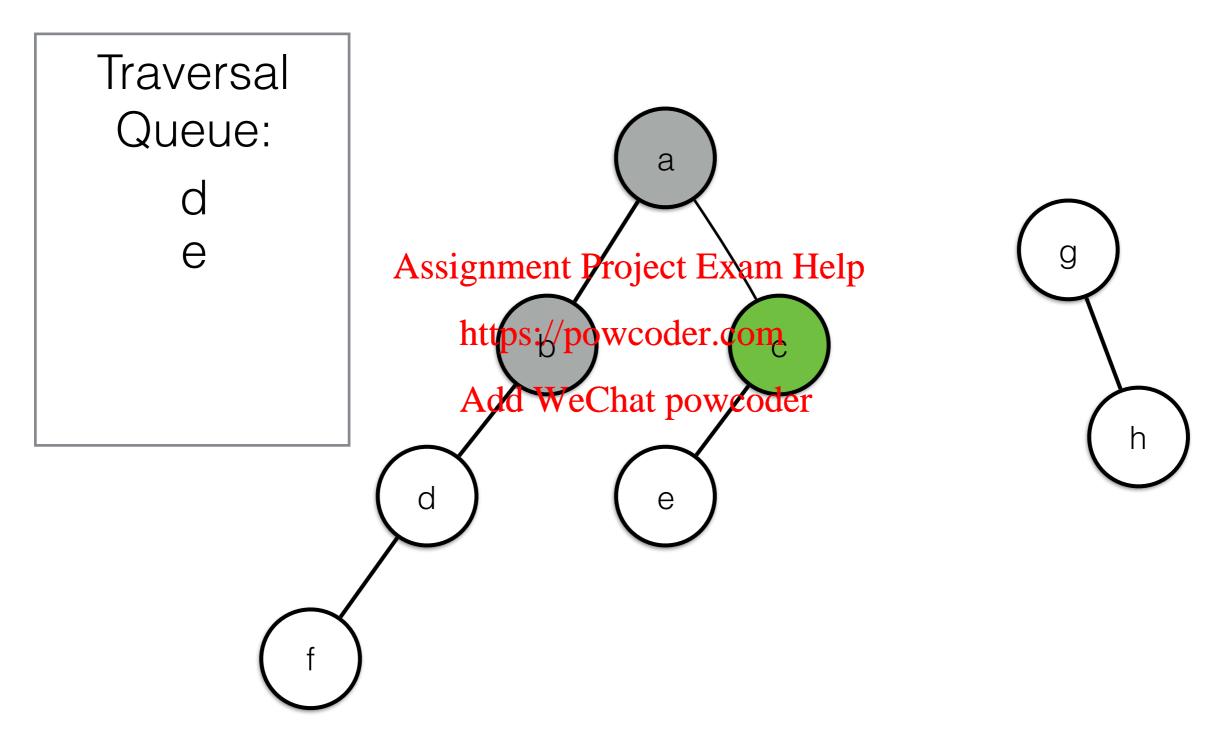

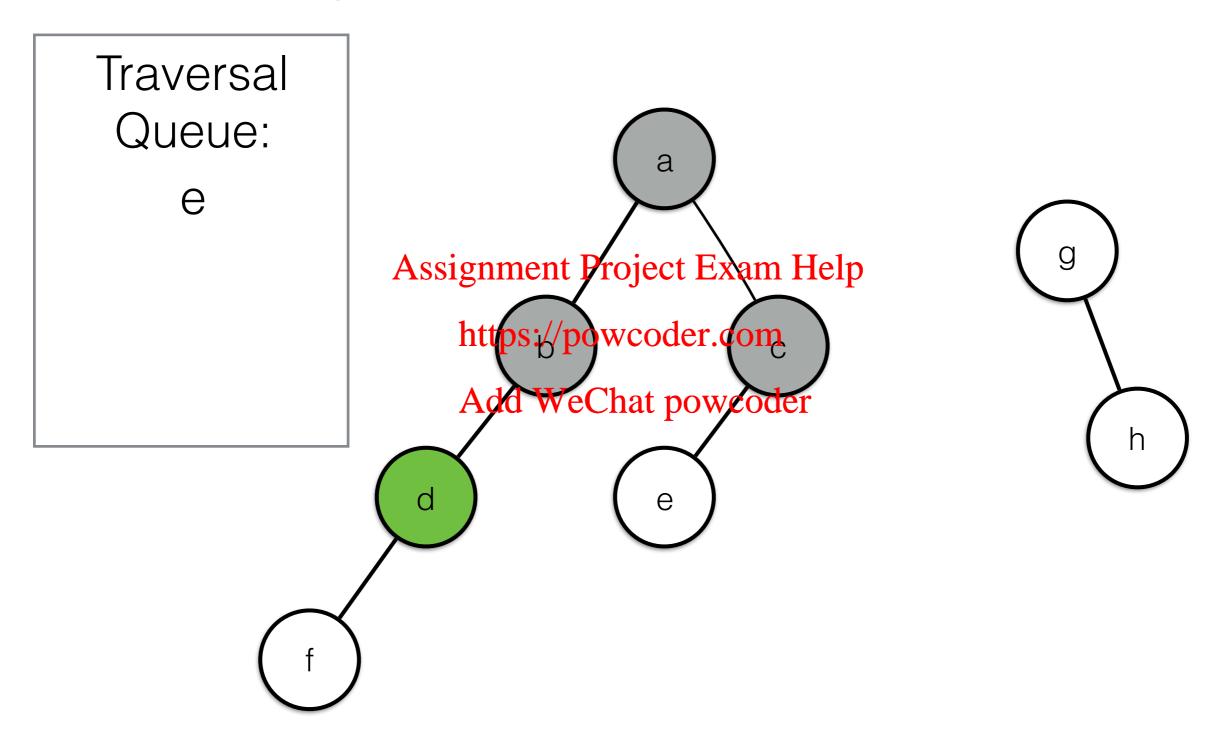

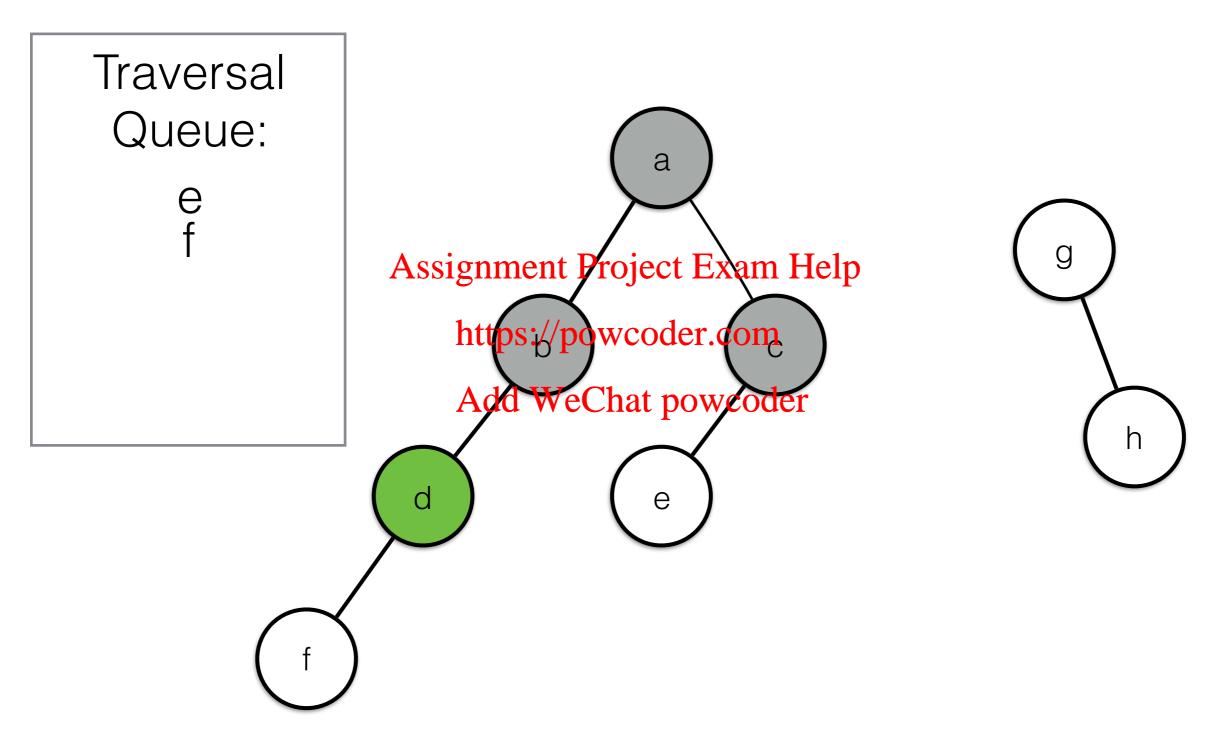

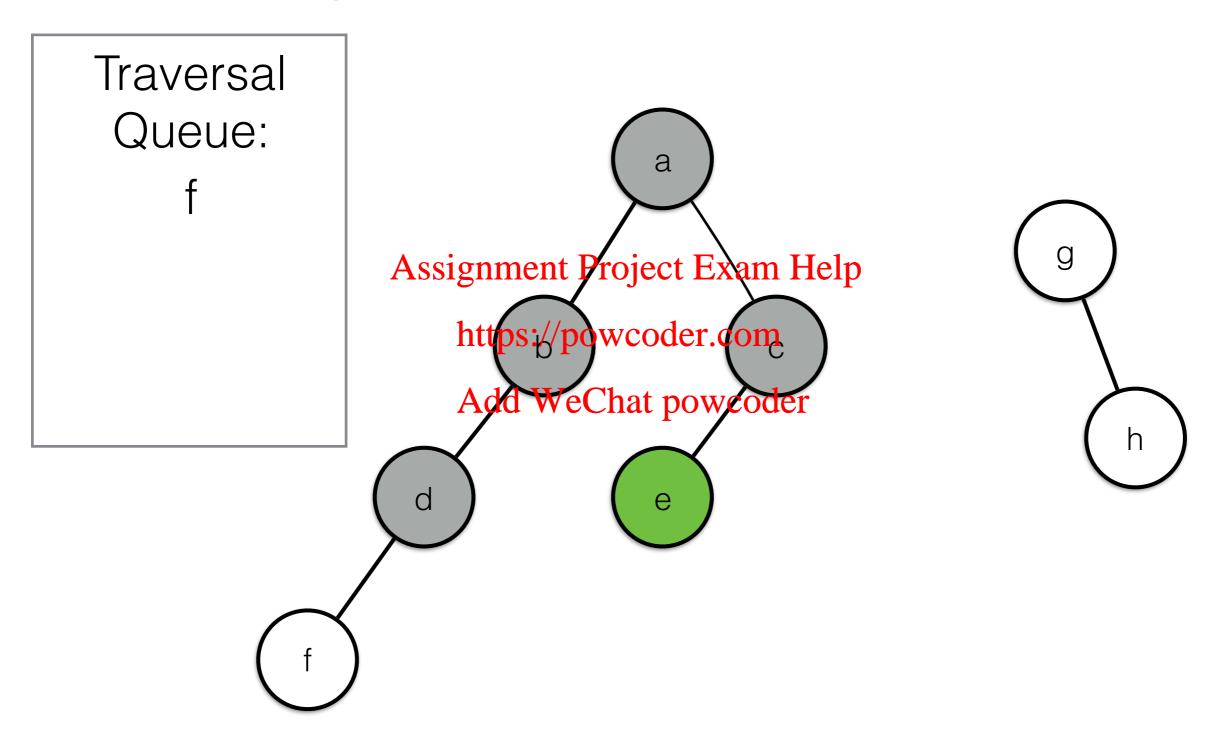

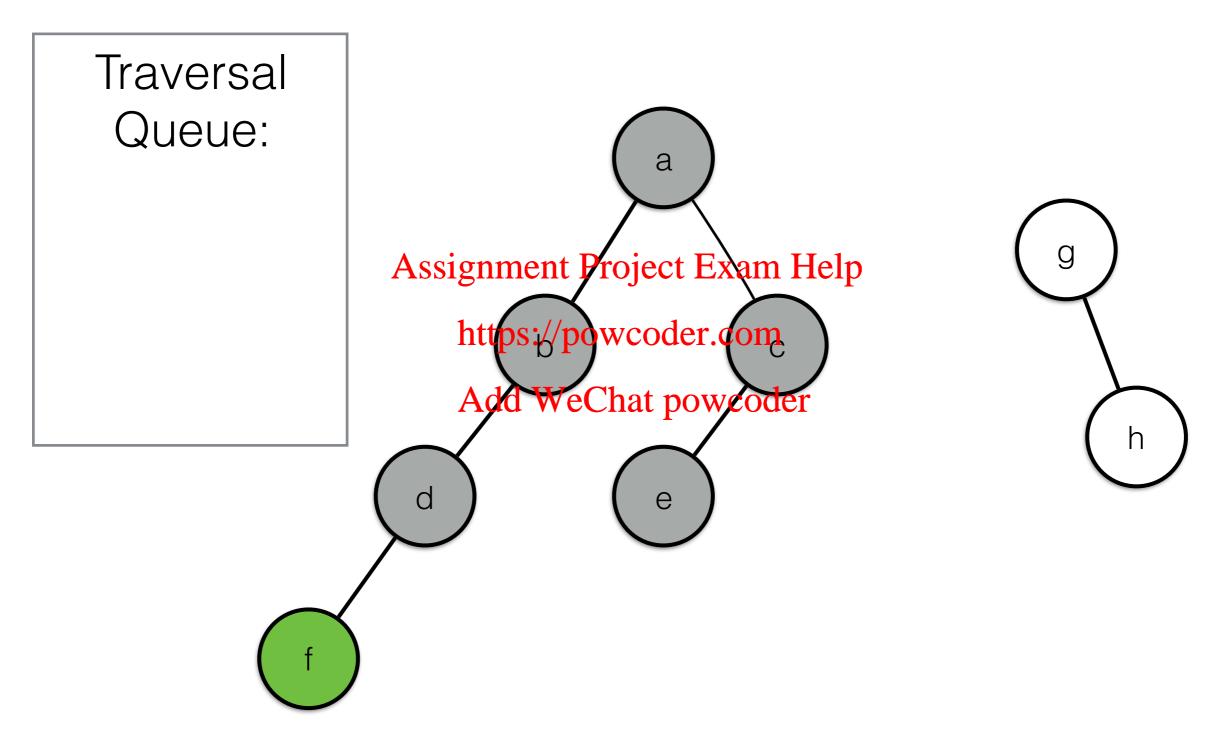

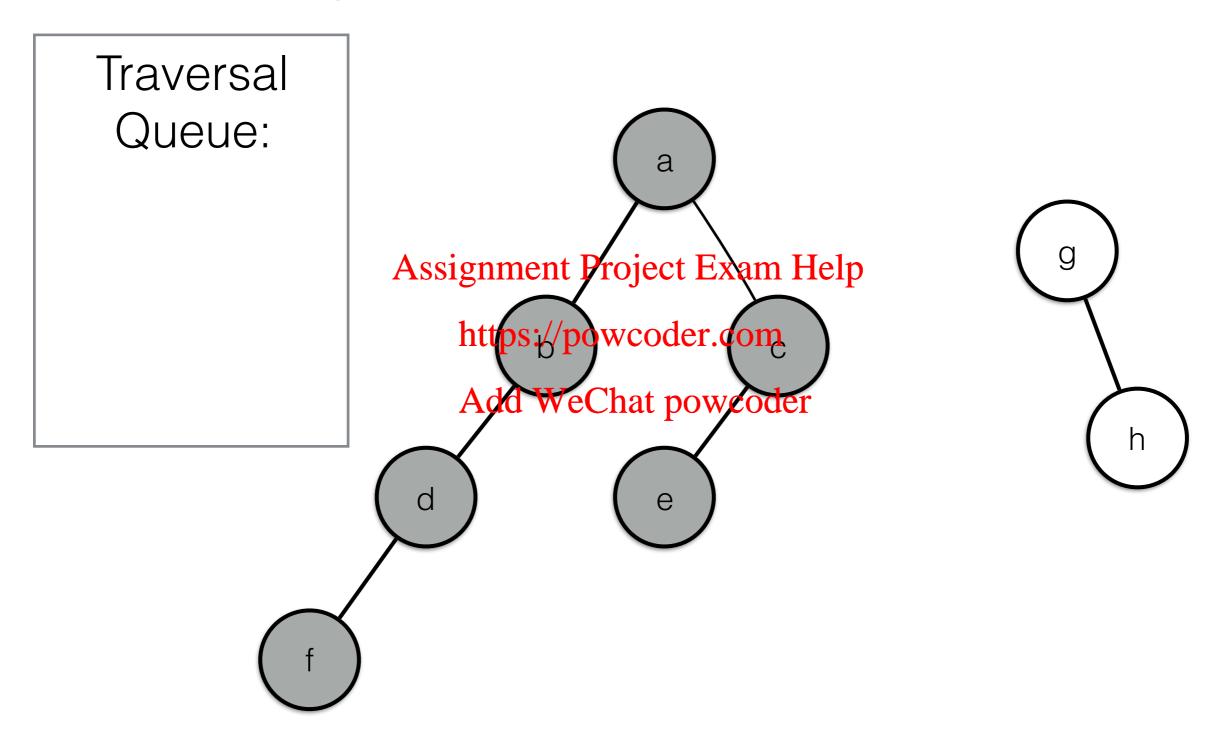

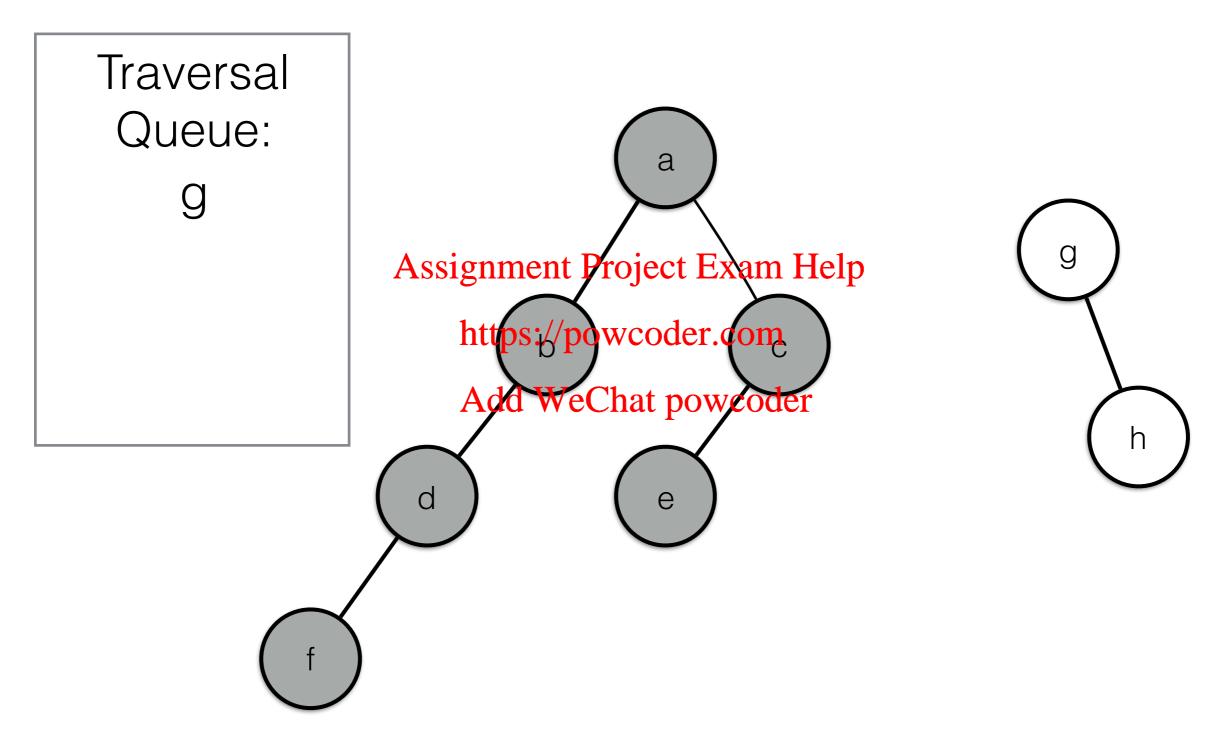

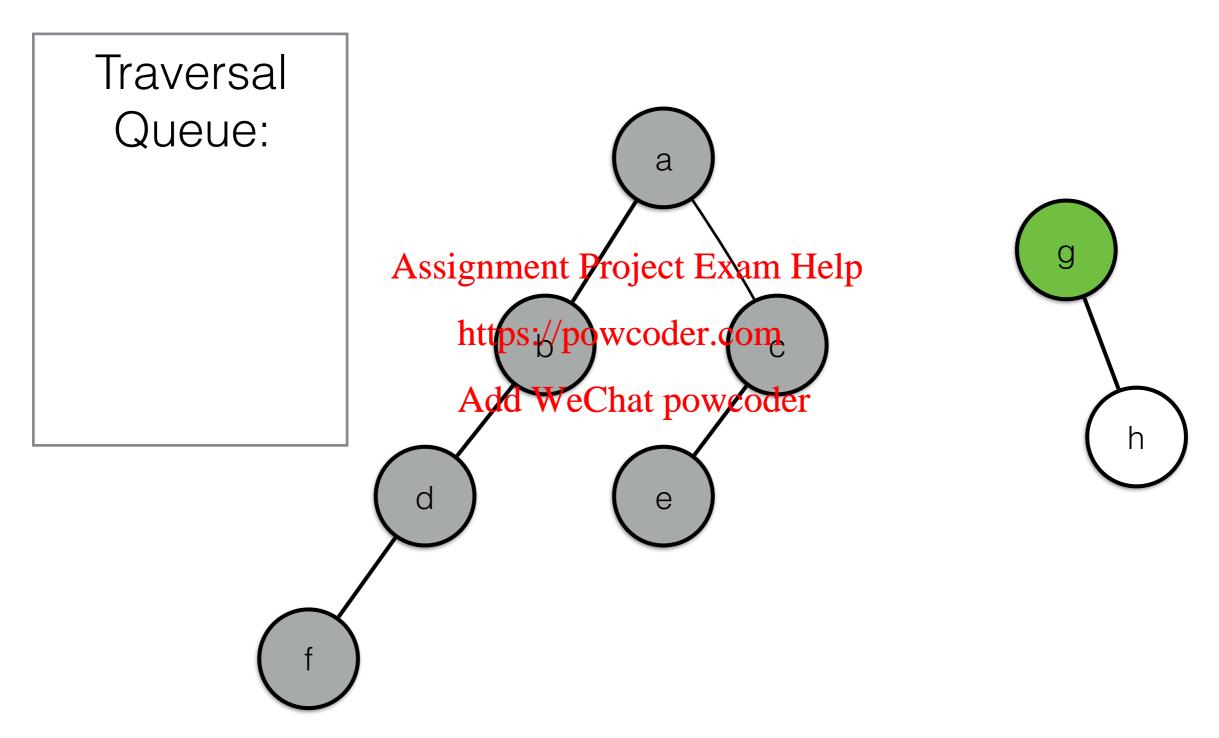

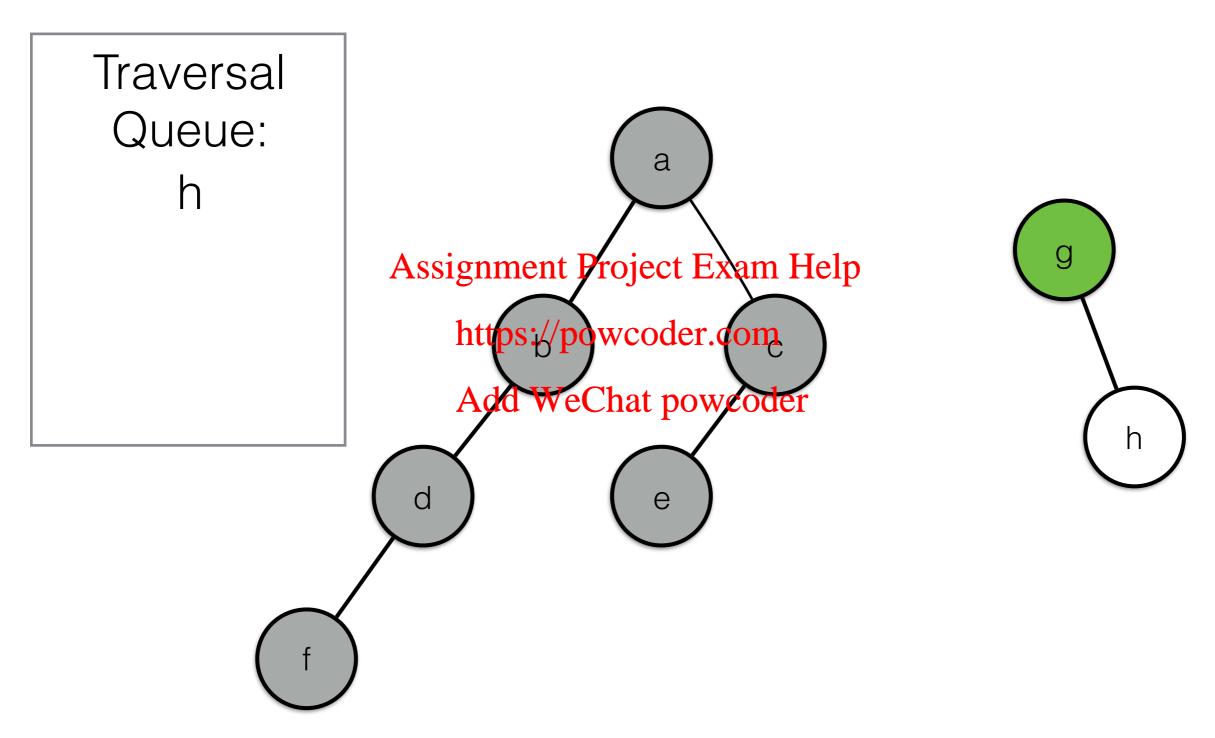

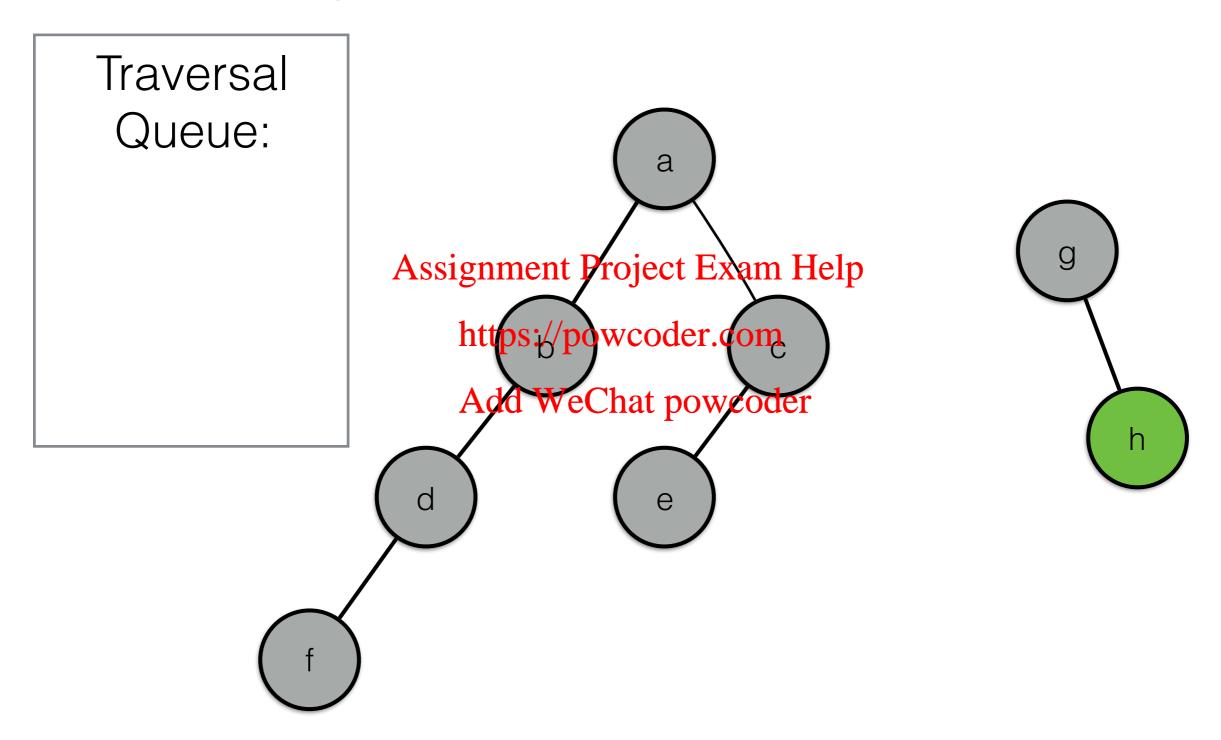

Breadth-First Search Algorithm

```
function BFS(\langle V, E \rangle)
    mark each node in V with 0
    count \leftarrow 0, init(queue)
                                                 create an empty queue
    for each v in V do
        if v is marked with 0 then Assignment Project Exam Help count \leftarrow count + 1
            mark v with https://powcoder.com
            inject(queue, x) d WeChat powcodequeue containing just v
            while queue is non-empty do
                u \leftarrow eject(queue)
                                                              ⊳ dequeues u
                for each edge (u, w) do
                                                     \triangleright w is u's neighbour
                     if w is marked with 0 then
                         count \leftarrow count + 1
                         mark w with count
                         inject(queue, w)
                                                              ▷ enqueues w
```

BFS Algorithm Notes

- BFS has the same complexity as DFS.
- Again, the same algorithm works for directed graphs as well_{Assignment Project Exam Help}
- Certain problems are most easily solved by adapting BFS.

 https://powcoder.com
 are most easily solved by Add WeChat powcoder
- For example, given a graph and two nodes, a and b in the graph, how would you find the length of the shortest path from a to b?

Breadth-First Search Forest

BFS **Tree** for this connected graph:

In general, we may get a BFS **Forest**

Topological Sorting

- We mentioned scheduling problems and their representation by directed graphs.
- Assume a directed edge from a to b means that task a must be completed before b can be started.

• The graph must be a dag; otherwise the problem cannot be https://powcoder.com solved.

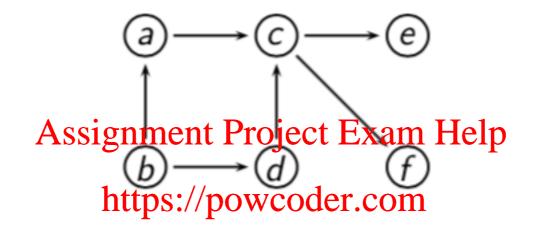

Add WeChat powcoder

- Assume the tasks are carried out by a single person, unable to multi-task.
- Then we should try to **linearize** the graph, that is, order the nodes as a sequence $v_1, v_2, ..., v_n$ such that for each edge $(v_i, v_i) \in E$, we have v_i comes before v_i in the sequence (that is, v_i is scheduled to happen before v_i).

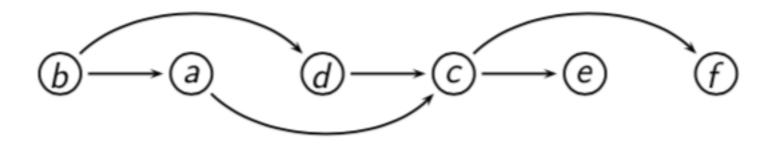

Topological Sorting Example

There are 4 ways to linearise the following graph

Add WeChat powcoder Here is one:

Topological Sorting Algorithm 1

- We can solve the top-sort problem with depth-first search:
 - 1. Perform DFS and note the order in which nodes are popped off the stack.
 - 2. List the nodes in the reverse of that order.
 Assignment Project Exam Help
- This works because the water of the control of the co

Add WeChat powcoder

- If (u,v) is an edge then it is possible (given some way of deciding ties) to arrive at a DFS stack with u sitting below v.
- Taking the "reverse popping order" ensures that u is listed before v.

Using the DFS method and resolving ties by using alphabetical order, the graph gives rise to the traversal stack shown on the right (the popping order shown in red):

Taking the nodes in reverse popping order yields b, d, a, c, f, e.

Topological Sorting Algorithm 2

• An alternative method would be to repeatedly select a random **source** in the graph (that is, a node with no incoming edges), list it, and remove it from the graph (including removing its outgoing edges).

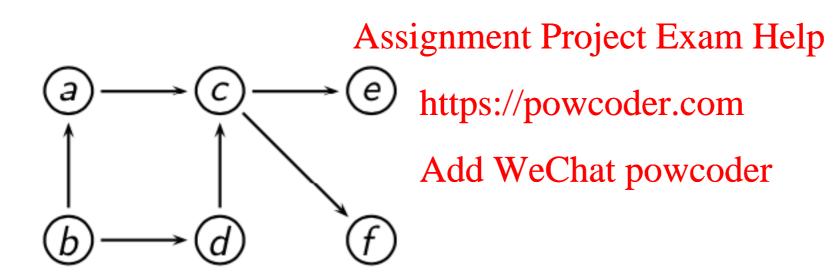

Assignment Project Exam Help

https://powcoder.com

- This is a very natural approprohedut it has the drawback that we repeatedly need to scan the graph for a source.
- However, it exemplifies the general principle of decrease-and-conquer.

Using the source removal method (and resolving ties alphabetically):

Topological sorted order:
